ABSTRACT
Endeavour (<http://www.esat.kuleuven.be/endeauro>) web site is an open access web server that allows users to search their genomes for genes that are involved in a specific biological process. This process leads to the generation of a large amount of genomic data and the creation and maintenance of corresponding databases. However, identifying genes involved in a particular process or disease remains a major challenge. Nevertheless, there is much evidence to suggest that functionally related genes tend to have similar profiles (1–3). To identify which genes are responsible for which phenotype, association studies and linkage analyses are often used, resulting in large lists of candidate genes. In the present

BACKGROUND
With the recent improvements in high-throughput technologies, many organisms have seen their genomes sequenced, most importantly annotated. This process leads to the generation of a large amount of genomic data and the creation and maintenance of corresponding databases. However, identifying genes involved in a particular process or disease remains a major challenge. Nevertheless, there is much evidence to suggest that functionally related genes tend to have similar profiles (1–3). To identify which genes are responsible for which phenotype, association studies and linkage analyses are often used, resulting in large lists of candidate genes. In the present

Received February 7, 2008; Revised April 30, 2008; Accepted May 7, 2008

ABSTRACT
Endeavour (<http://www.esat.kuleuven.be/endeauro>) web: the web site is a tool and a database for gene prioritization in multiple species and there is no longer requirement is a web resource for gene prioritization of candidate genes. Using a training set of genes known to be involved in a biological process of interest, our approach consists of (i) inferring several models (based on various data sources), (ii) applying each model to the candidate genes to rank those candidates against the profile of the known genes and (iii) merging the several rankings into a global ranking of the candidate genes. In the present

BACKGROUND
With the recent improvements in high-throughput technologies, many organisms have seen their genomes sequenced, most importantly annotated. This process leads to the generation of a large amount of genomic data and the creation and maintenance of corresponding databases. However, linking genomic data to biological knowledge to identify genes involved in a particular process or disease remains a major challenge. Nevertheless, there is much evidence to suggest that functionally related genes tend to share similar patterns of expression (1–3). To identify which genes are responsible for which phenotype, association studies and linkage analyses are often used, resulting in large lists of candidate genes. In

Gene
Ontology

Définitions

- (Identifiants de) **gène** → ARNm → protéine
- **G** : ensemble des gènes d'un organisme
- *Fonction de regroupement* : relation entre gènes basée sur un indice de similarité.
- *Ensemble de (gènes) voisins* : ensemble de gènes $E \subseteq G$ regroupés par une fonction de regroupement.
- *Voisinage* : sous-ensemble de $P(G)$ formant un ensemble d'ensembles de voisins, $V \subseteq P(G)$, regroupés par une même fonction de regroupement.

$$V = \{E_1, E_2, E_3, E_4, E_5, E_6\} \subseteq P(G)$$

Représentation d'un voisinage : ordre partiel (poset)

- Un voisinage est un ensemble (d'ensembles de voisins) ordonné par la relation d'inclusion \subseteq

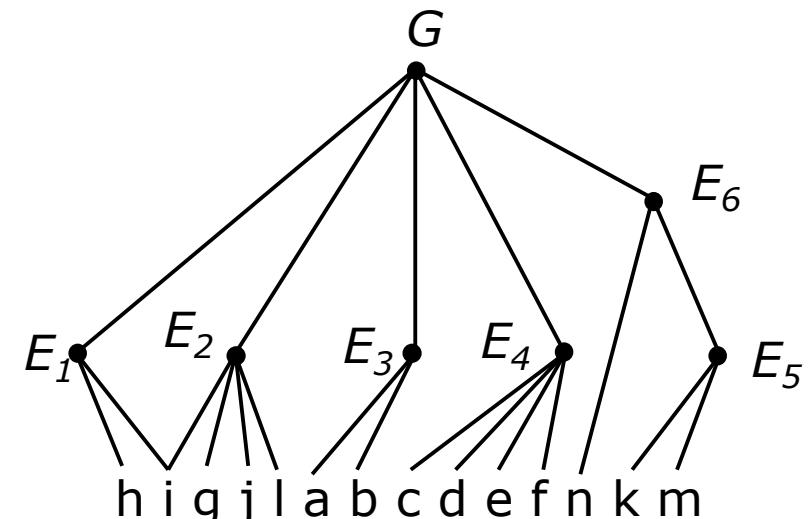

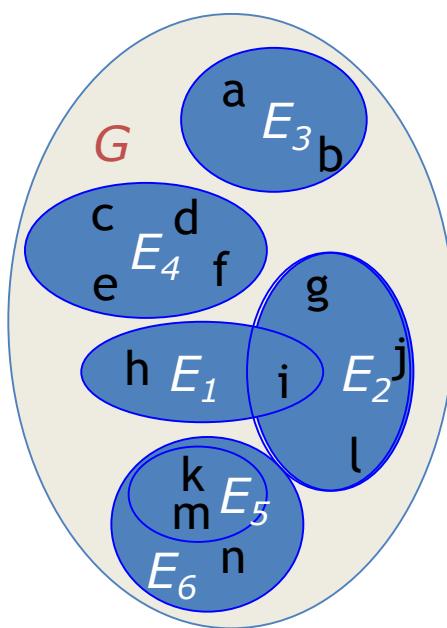

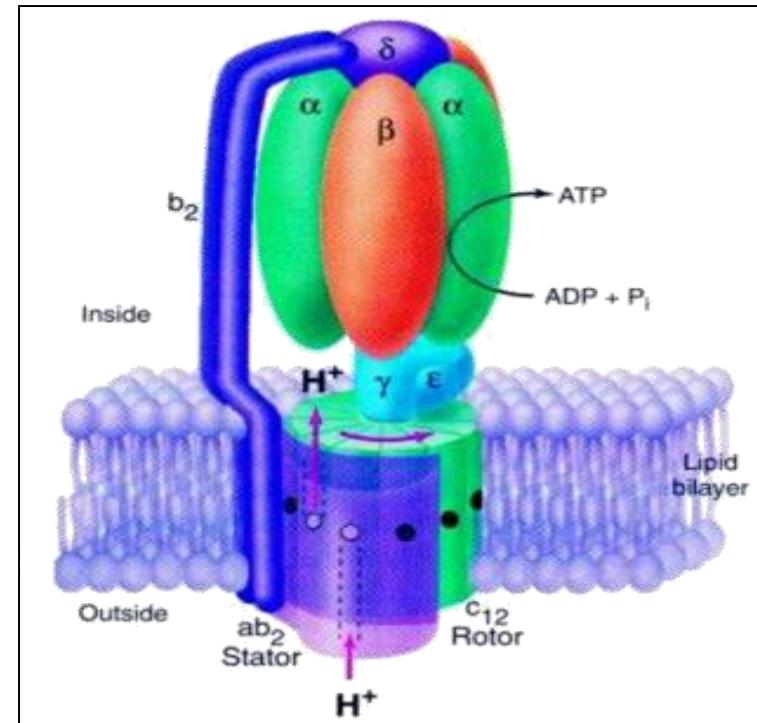

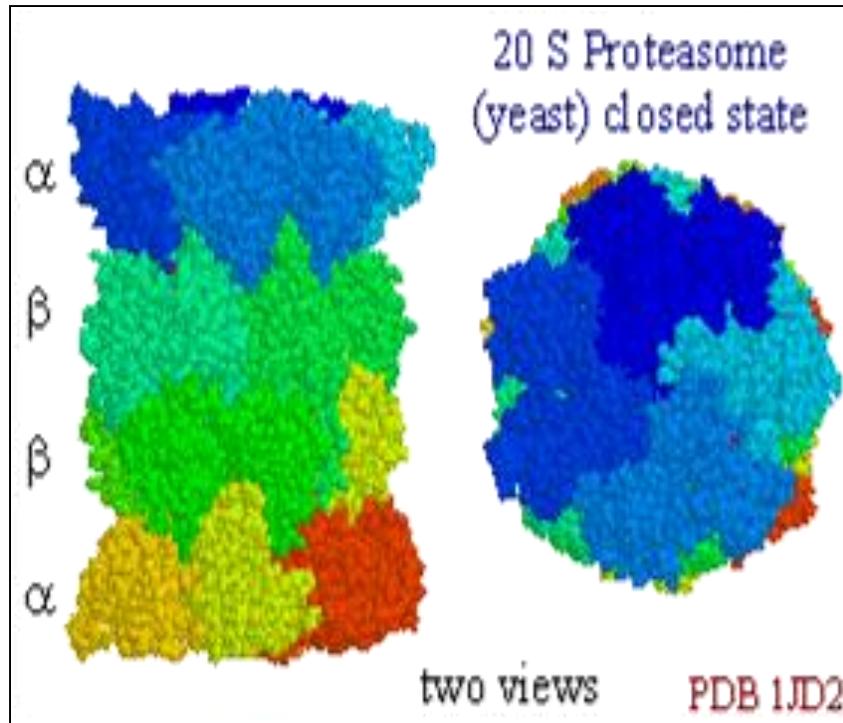

diagramme de Hasse de V

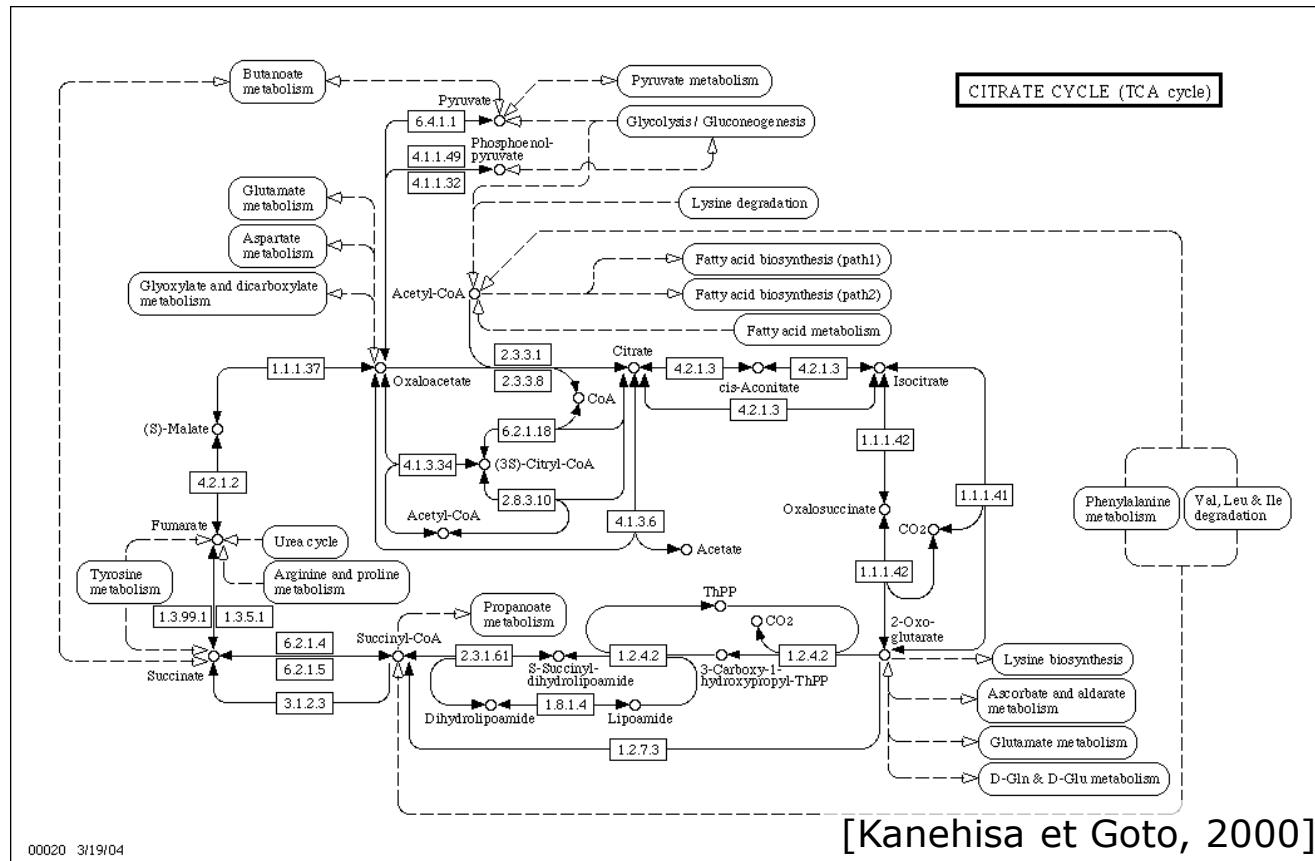

$$V = \{E_1, E_2, E_3, E_4, E_5, E_6\}$$

Exemple de fonction de regroupement : complexes protéiques

un complexe → un ensemble de protéines

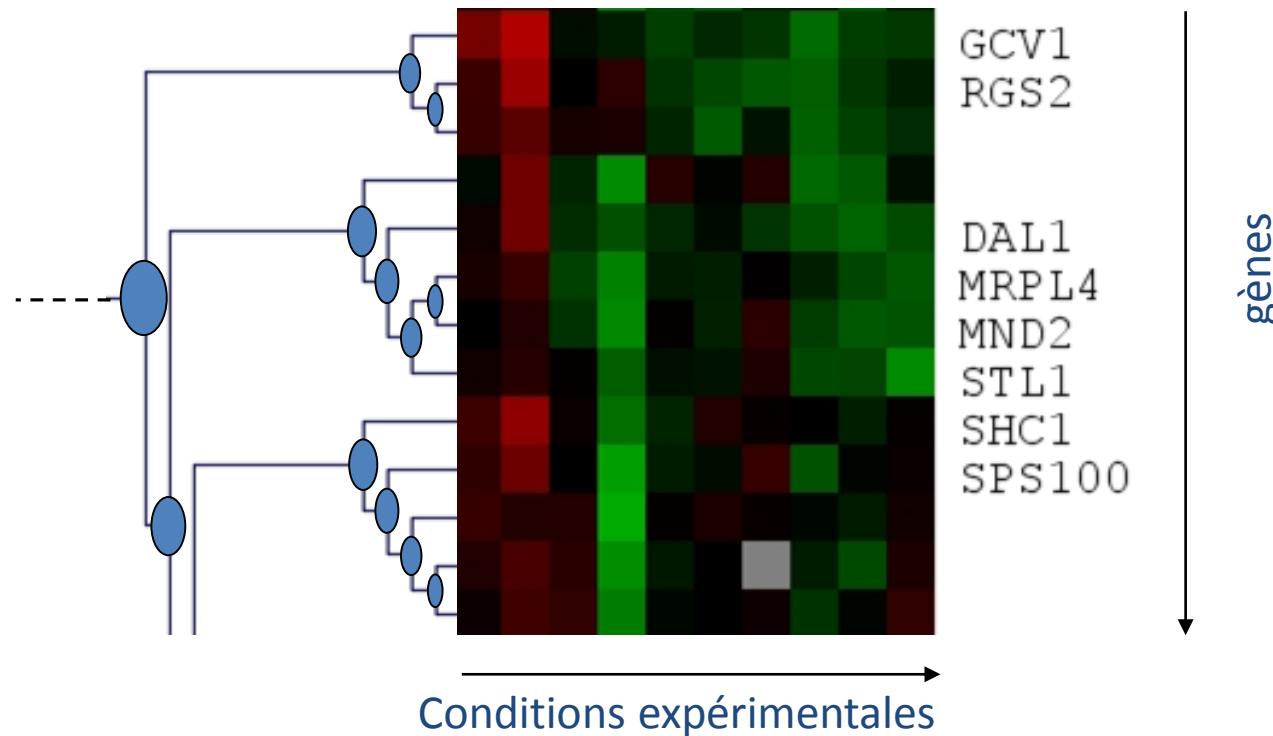

Exemple de critère de regroupement : voies métaboliques

une voie métabolique → un ensemble de protéines

Exemple de critère de regroupement : données d'expression

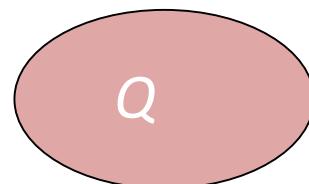

clustering hiérarchique
des profils

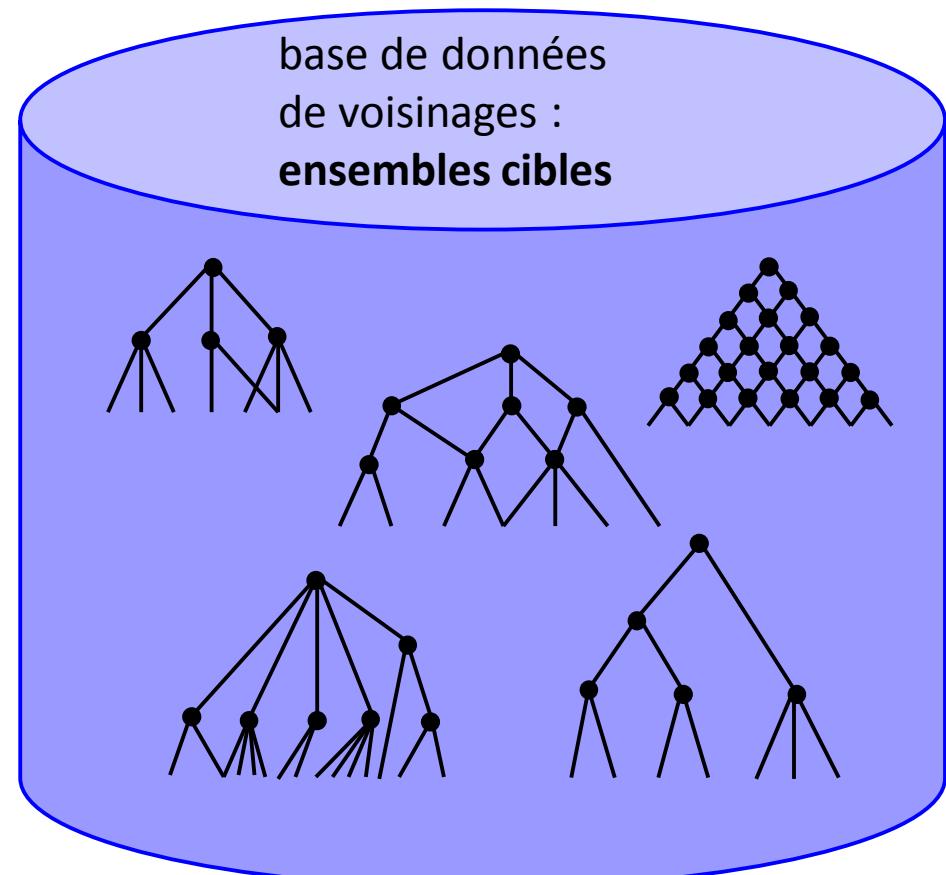

un cluster → un ensemble de gènes

- Recherche d'ensembles similaires

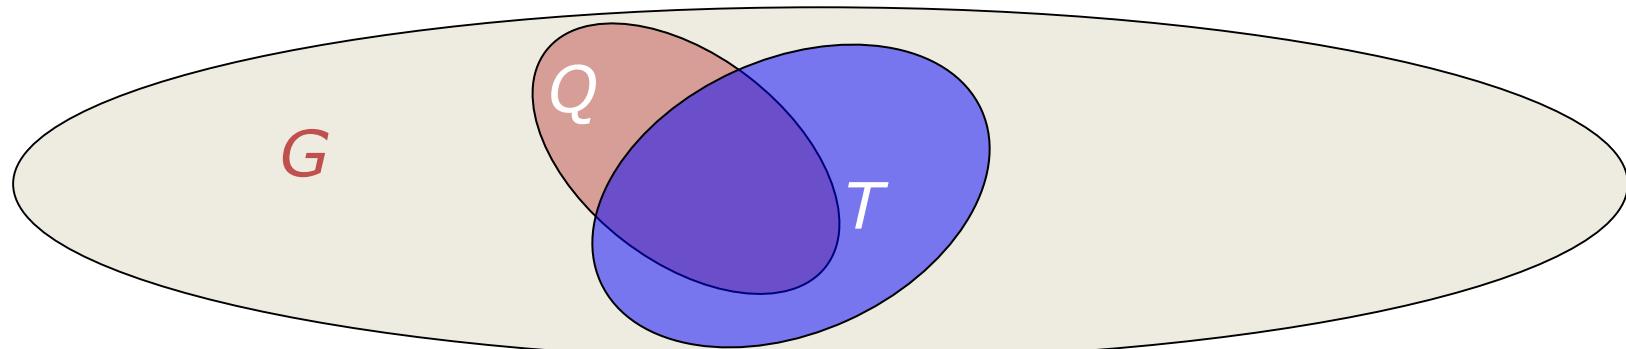

ensemble requête
 $Q \subseteq G$

Quels sont les
ensembles cibles
qui lui sont similaires ?

Mesure de (dis)similarité

- Loi hypergéométrique : probabilité d'avoir au moins le nombre d'éléments communs observé entre 2 échantillons issus d'une même population

$$p - \text{valeur } (c, t, q, g) = \sum_{k=c}^{\min(q, t)} \frac{\binom{t}{k} \binom{g-t}{q-k}}{\binom{g}{q}}$$

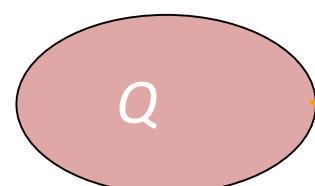

avec

- $g = |G|$: taille de la population
- $q = |Q|$: taille de l'ensemble requête
- $t = |T|$: taille de l'ensemble cible
- $c = |Q \cap T|$: nombre d'éléments communs

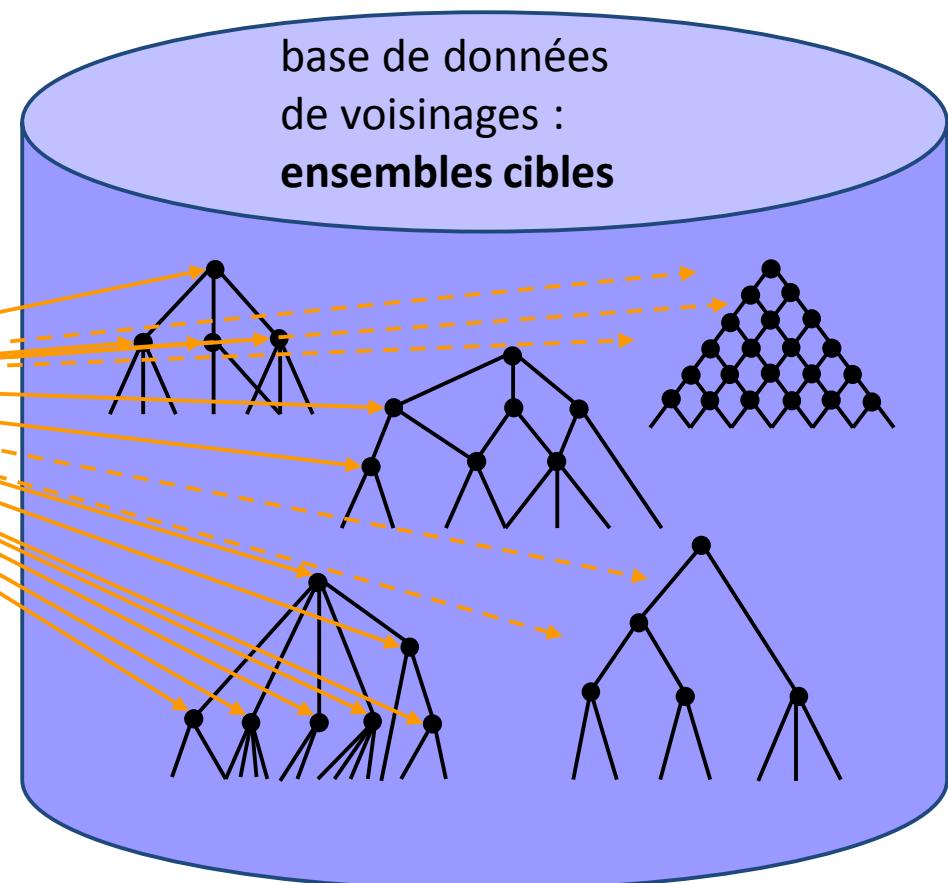

- Autres mesures :
 - ◆ Loi binomiale
 - ◆ χ^2
 - ◆ ratio, pourcentage

- Recherche d'ensembles similaires

ensemble requête
 $Q \subseteq G$

Quels sont les
ensembles cibles
qui lui sont similaires ?

- Probabilité d'obtenir une p-valeur aussi faible par hasard : fonction de répartition des p-valeurs minimales
- Simulations

RandomSet_1, minPi = M1

RandomSet_2, minPi = M2

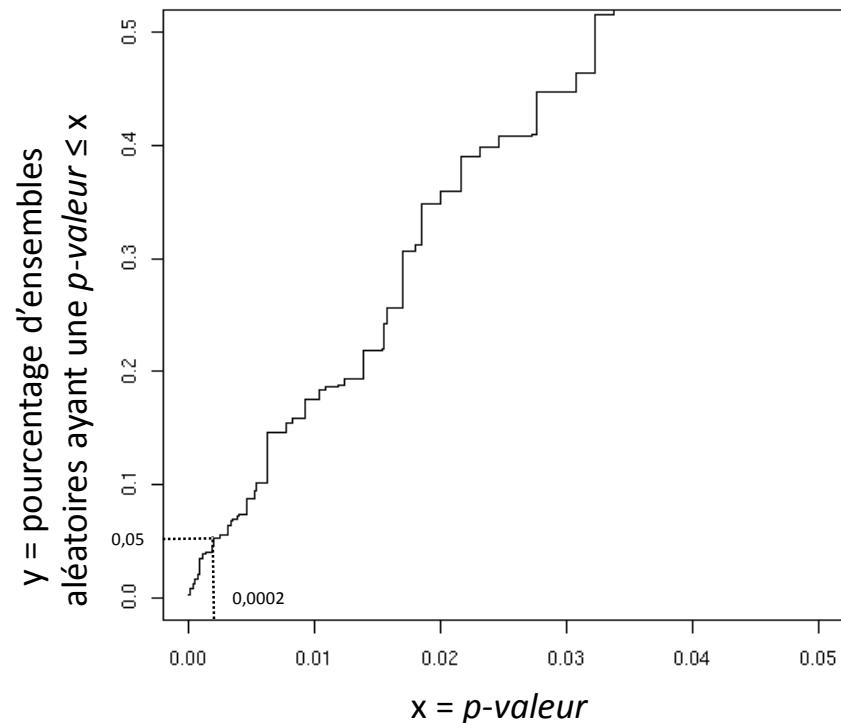

.

.

RandomSet_n, minPi = Mn

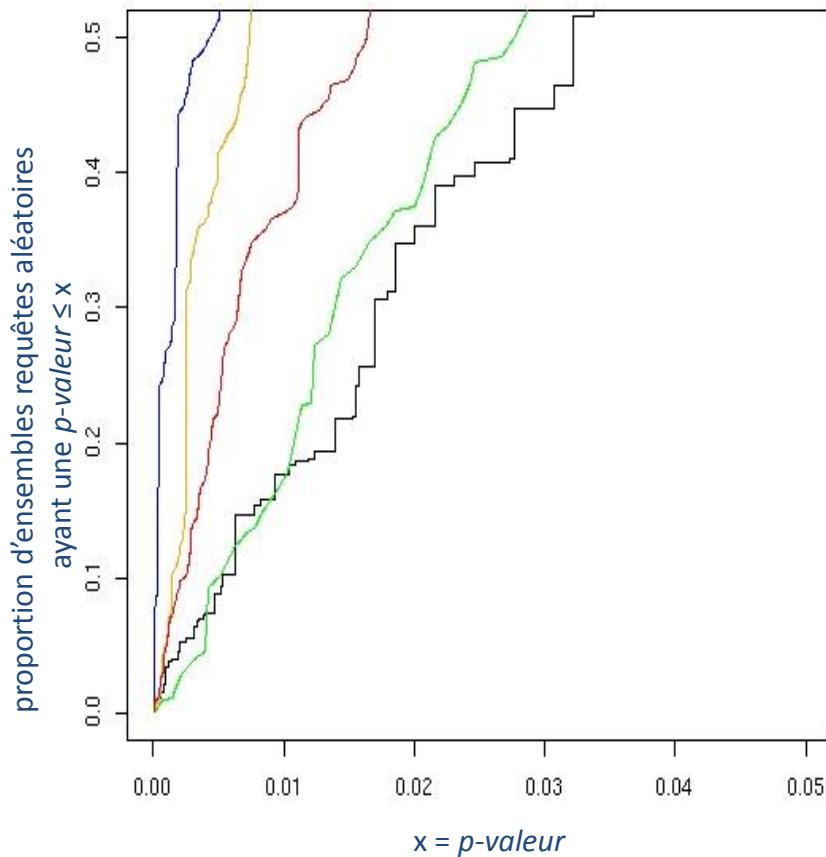

Étant donnée une p-valeur p

Combien ont un meilleur score ?

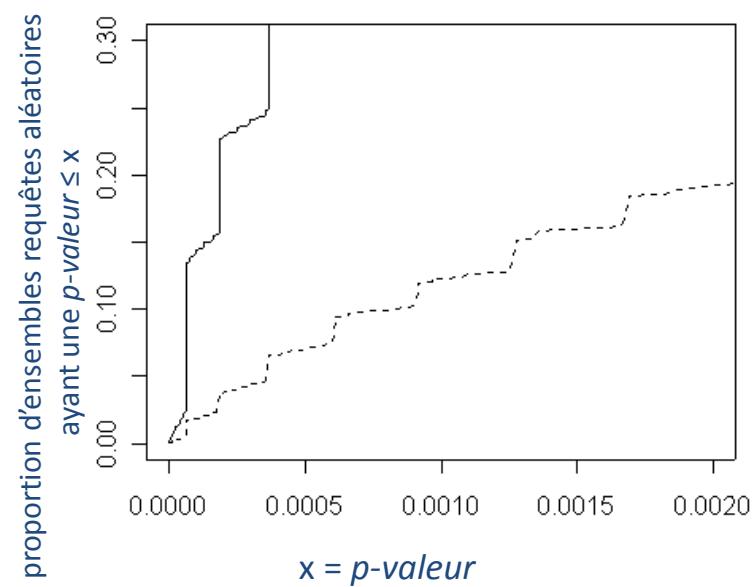

levure *Saccharomyces cerevisiae*
 $n=500, q=9, g=5786$, KEGG Pathways

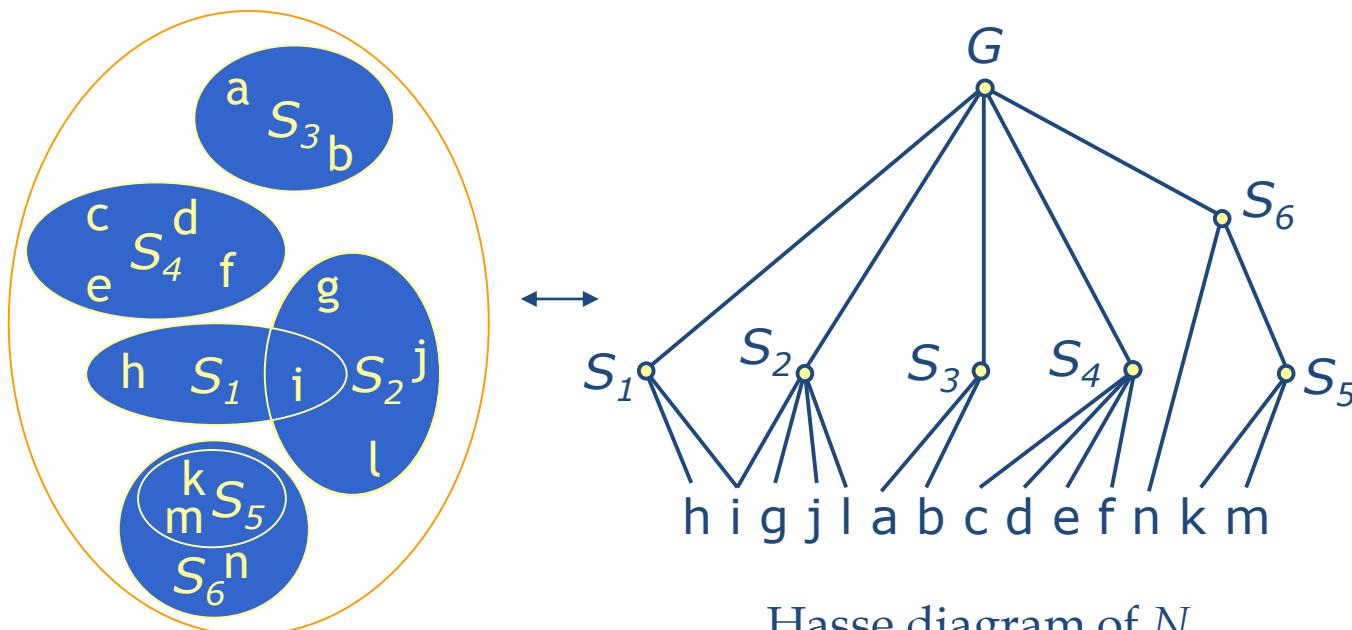

Significativité des p-valeurs obtenues

Saccharomyces cerevisiae
 $n=500$, $q=6-9-200-500-1000$,
 $g=5786$, KEGG Pathways

Saccharomyces cerevisiae
 $n=500$, $q=50$, $g=5786$,
— GO molecular function,
--- Ferea et al., 1999

$$N = \{S_1, S_2, S_3, S_4, S_5, S_6\}$$

a target set T is **pertinent** if

$$Q \cap T \neq \emptyset$$

and

$\nexists T' \in N$ such that $T' \subset T$ and $T' \cap Q = T \cap Q$

and

$\nexists T' \in N$ such that $T \subset T'$ and $T' - Q = T - Q$

Pertinence definition

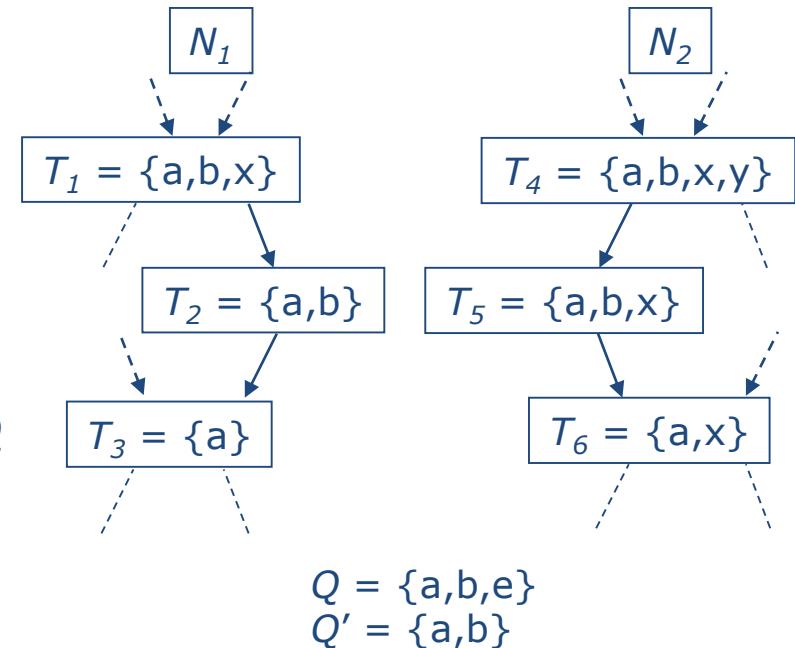

- Q a non empty query set
- N a neighborhood
- a target set $T \in N$
- T pertinent if

$$Q \cap T \neq \emptyset$$

and

$\nexists T' \in N$ such that $T' \subset T$ and $T' \cap Q = T \cap Q$
and

$\nexists T' \in N$ such that $T \subset T'$ and $T' - Q = T - Q$

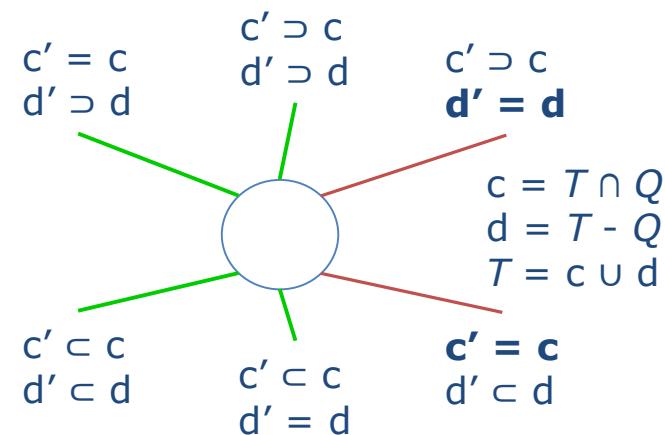

Local decision

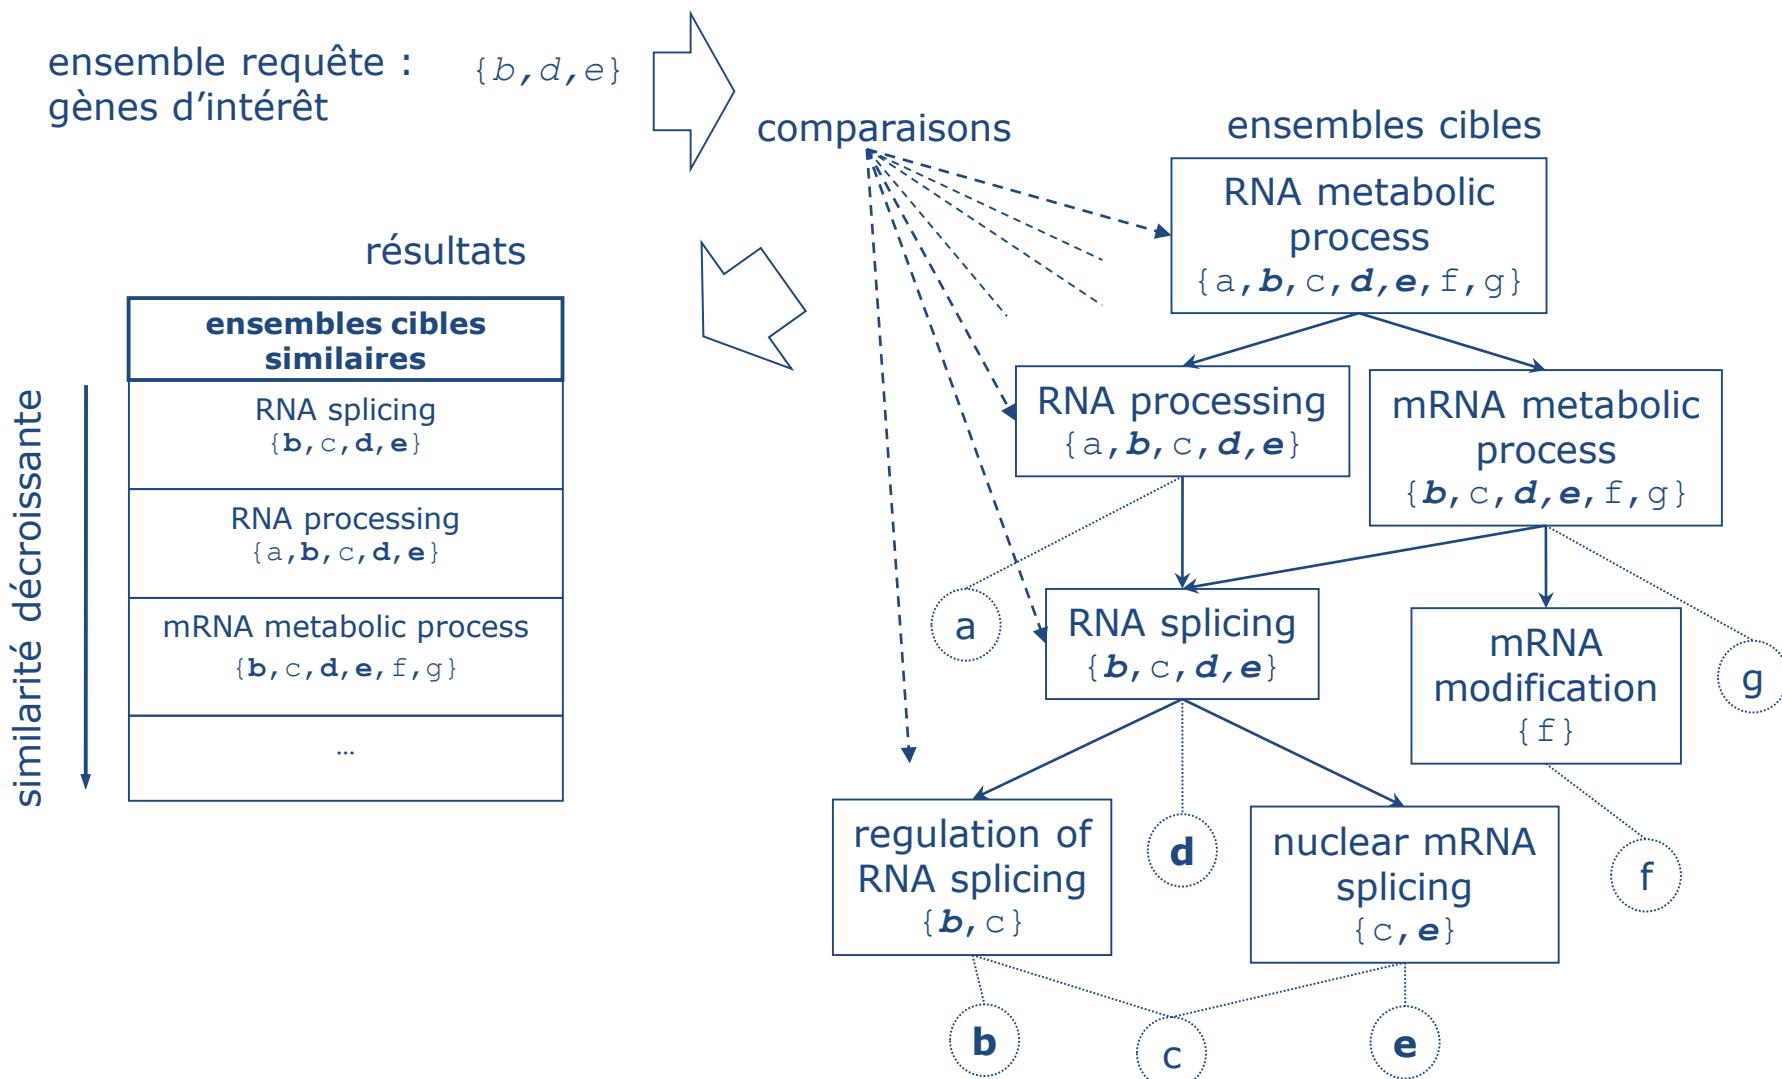

$$|c| > 0$$

$$|d| < \min(\{d_{\text{parents}}\})$$

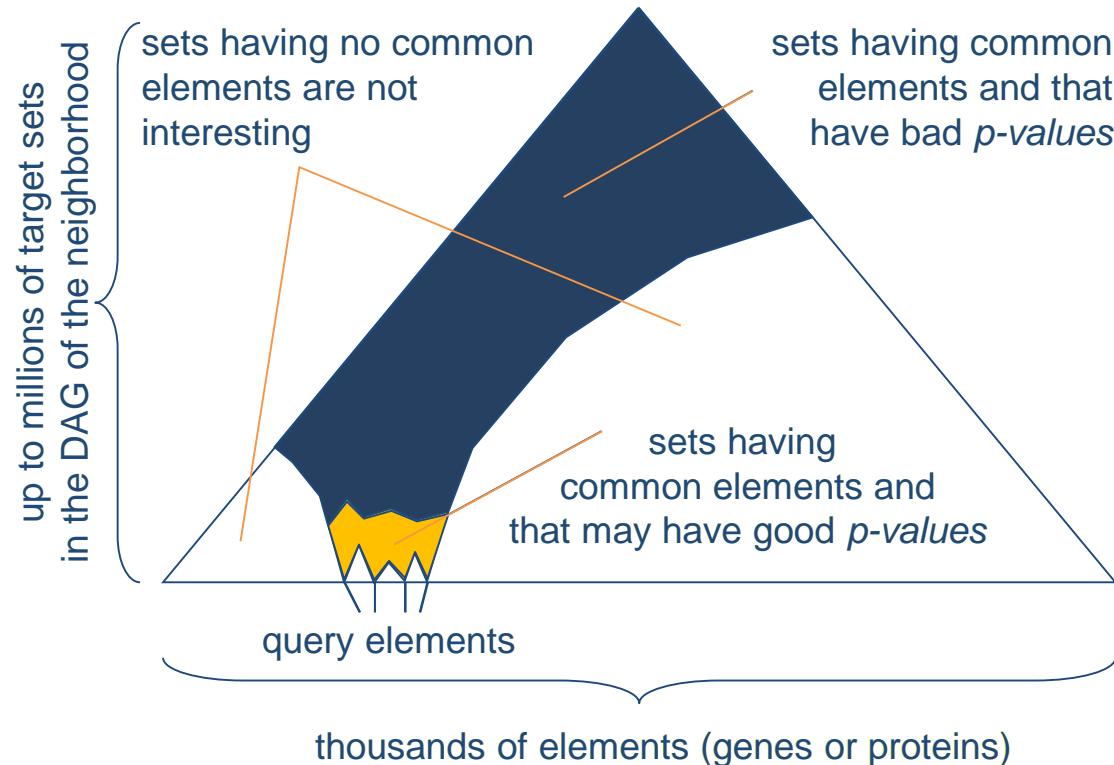

$$|c| > \max(\{c_{\text{children}}\})$$

• Pertinence des comparaisons & redondance des résultats

Further optimizations (1/2)

- each node has only 1 parent

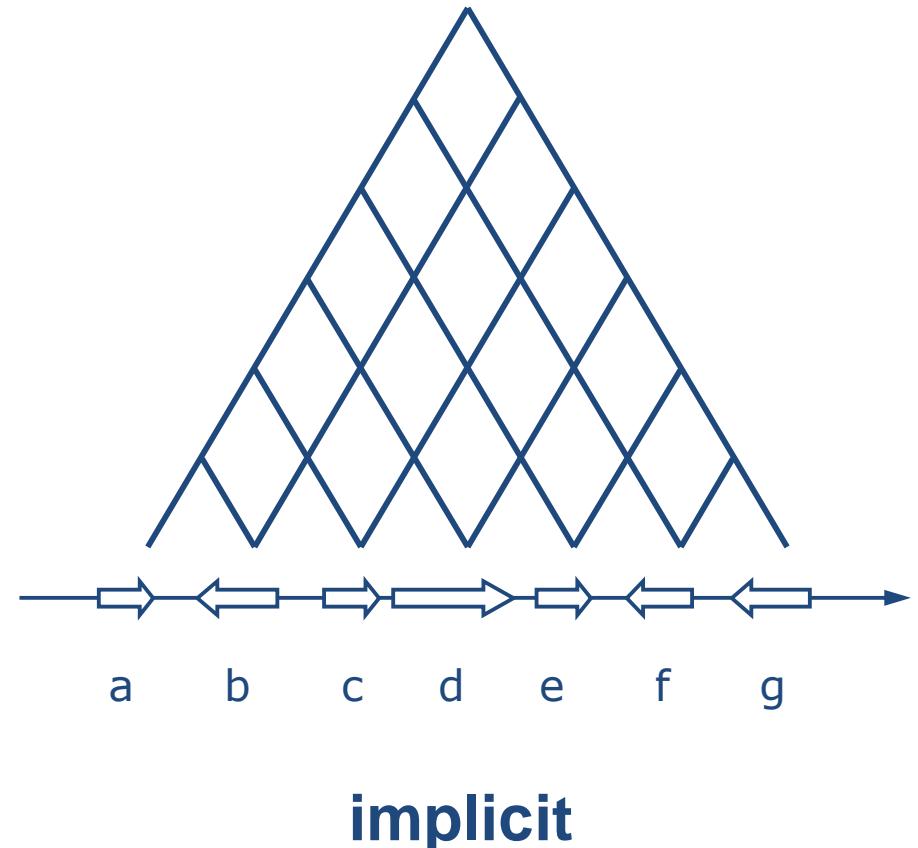

- Algorithm

- ◆ parses the input with a stack of stacks at the time it is loaded
- ◆ $O(|G|)$ time

Further optimizations (2/2)

- DAG is implicit, e.g. adjacent genes on the chromosome:
 - store the genes order
 - $\Theta(|G|)$ space instead of $\Theta(|G|^2)$
 - each pair of genes defines an interval which defines a set
- requires a specific algorithm
 - $O(|Q|^2)$ time

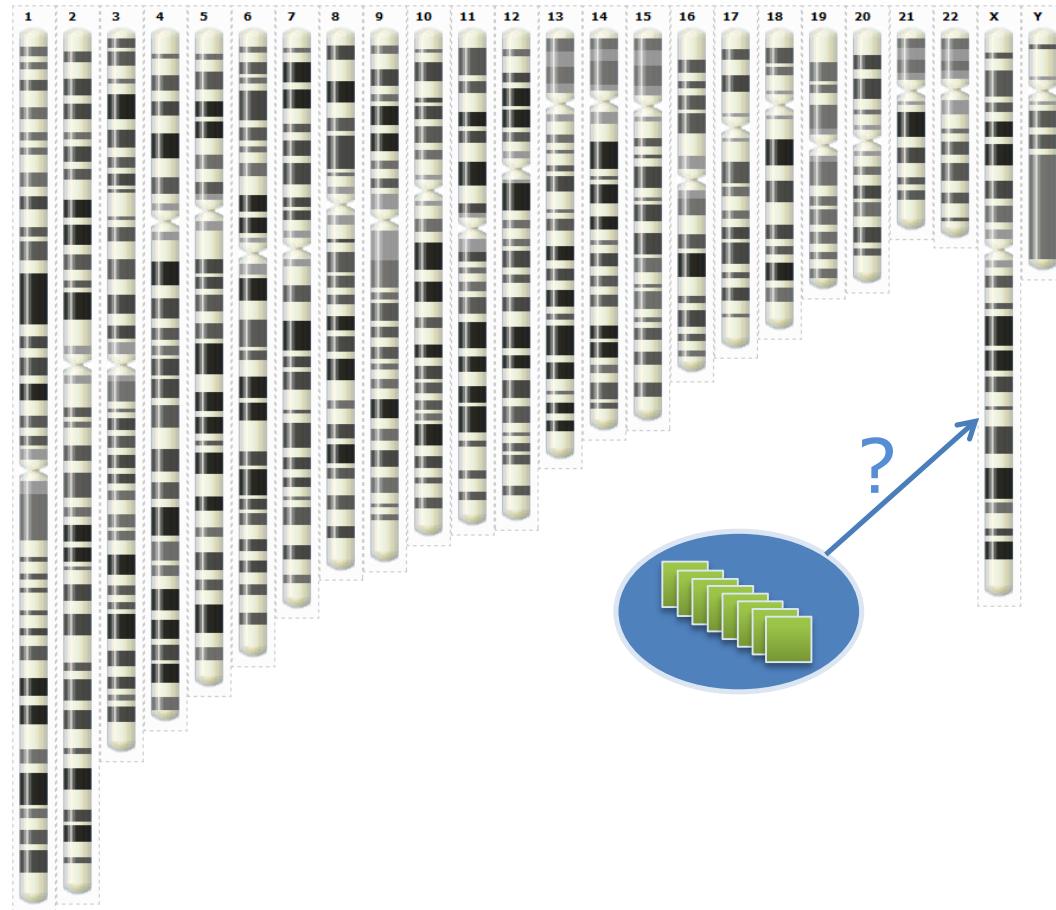

Context

Set of genes of interest

Examples

- ◆ Differentially expressed genes
- ◆ Co-expressed genes
- ◆ Tissue specific genes
- ◆ Partners of a protein complex
- ◆ Imprinted genes
- ◆ ...

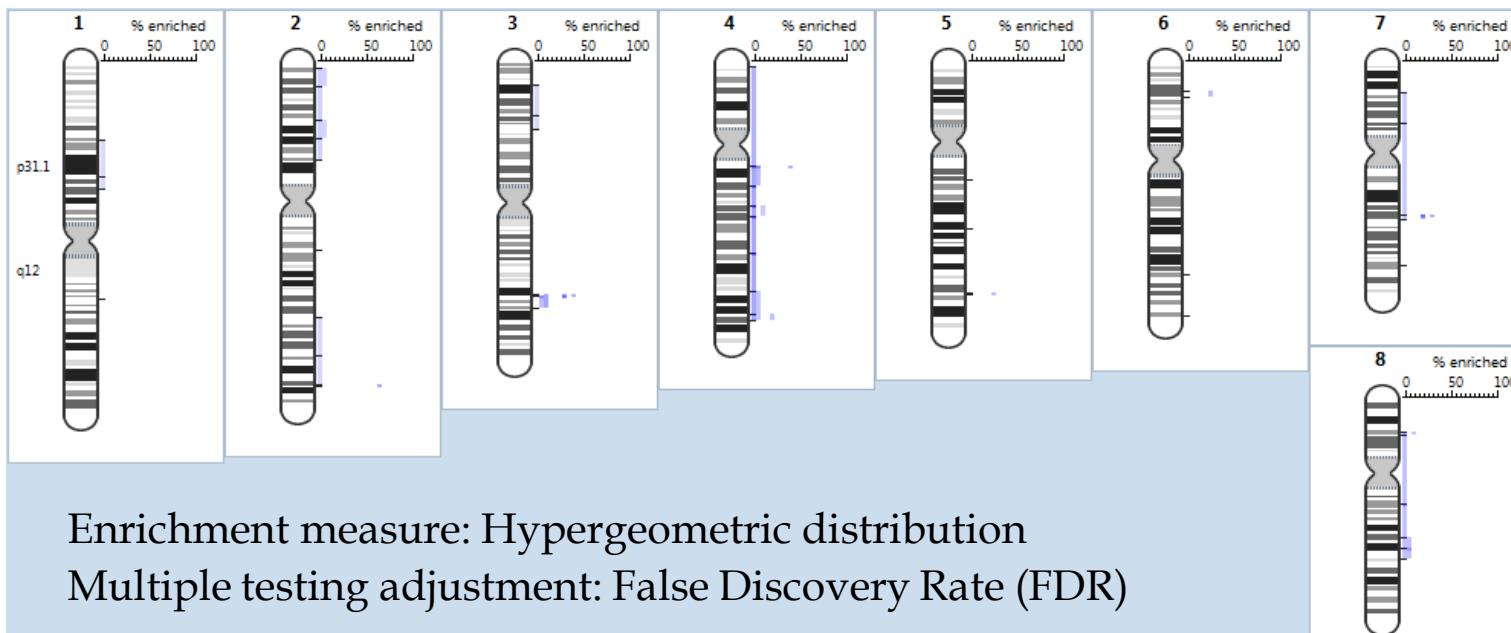

→ Question: Do those genes surprisingly cluster in the genome?

Goal: consider every possible region for enrichment

Down Syndrome differentially expressed genes

Experiment:

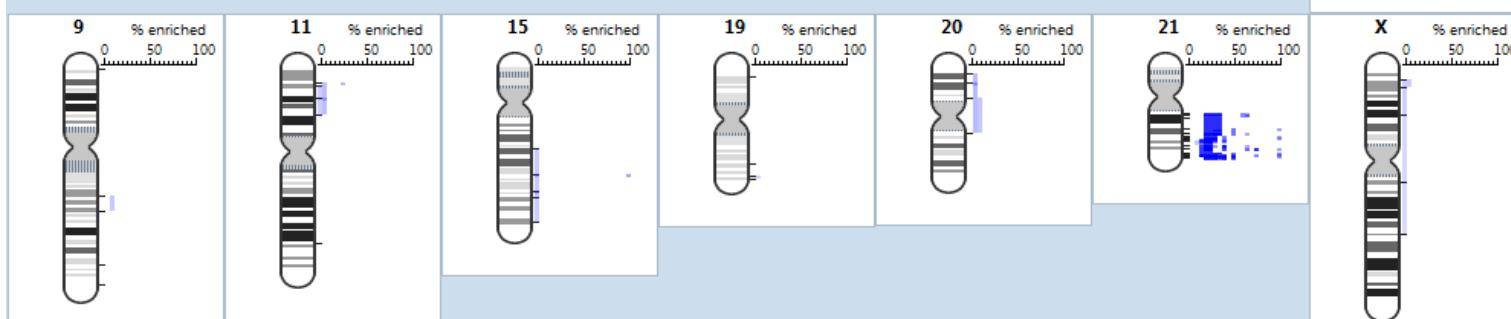

Published list of **differentially expressed genes in Down syndrome patients** from Mao, R., C.L. Zielke, H.R. Zielke, and J. Pevsner, Global up-regulation of chromosome 21 gene expression in the developing Down syndrome brain (2003) *Genomics* **81**: 457-467.

- Issues:**
- Number of regions to test
 - False positives
 - Redundancy

Enrichment measure: Hypergeometric distribution

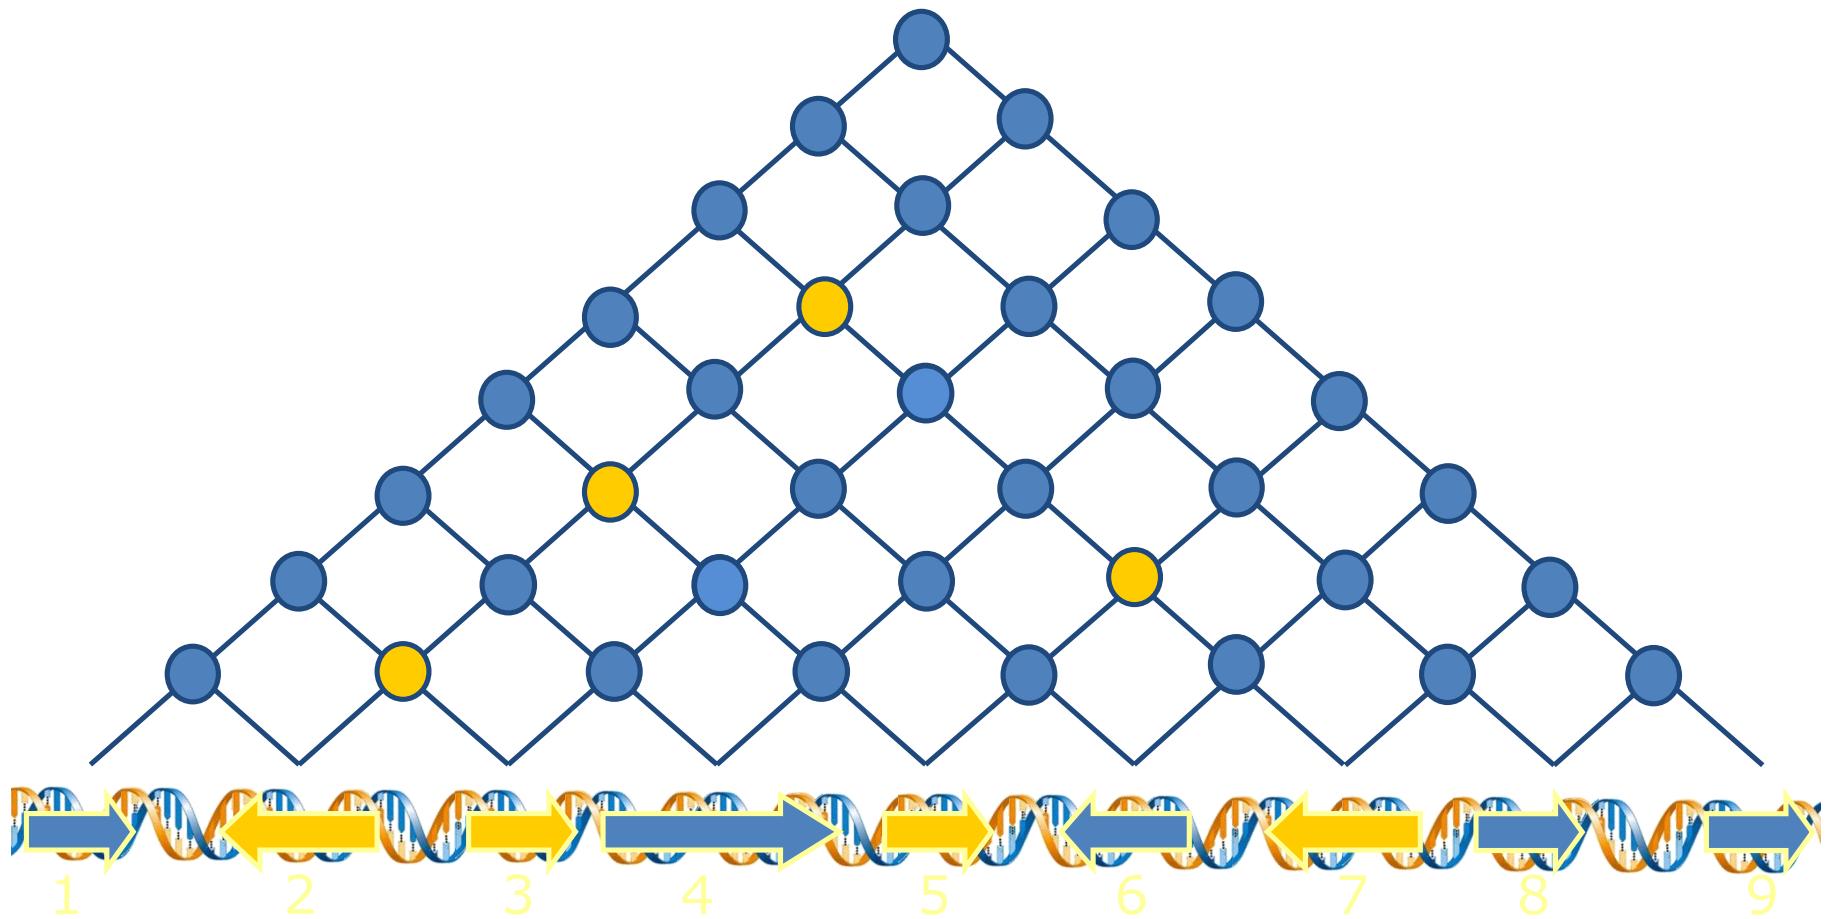

Multiple testing adjustment: False Discovery Rate (FDR)

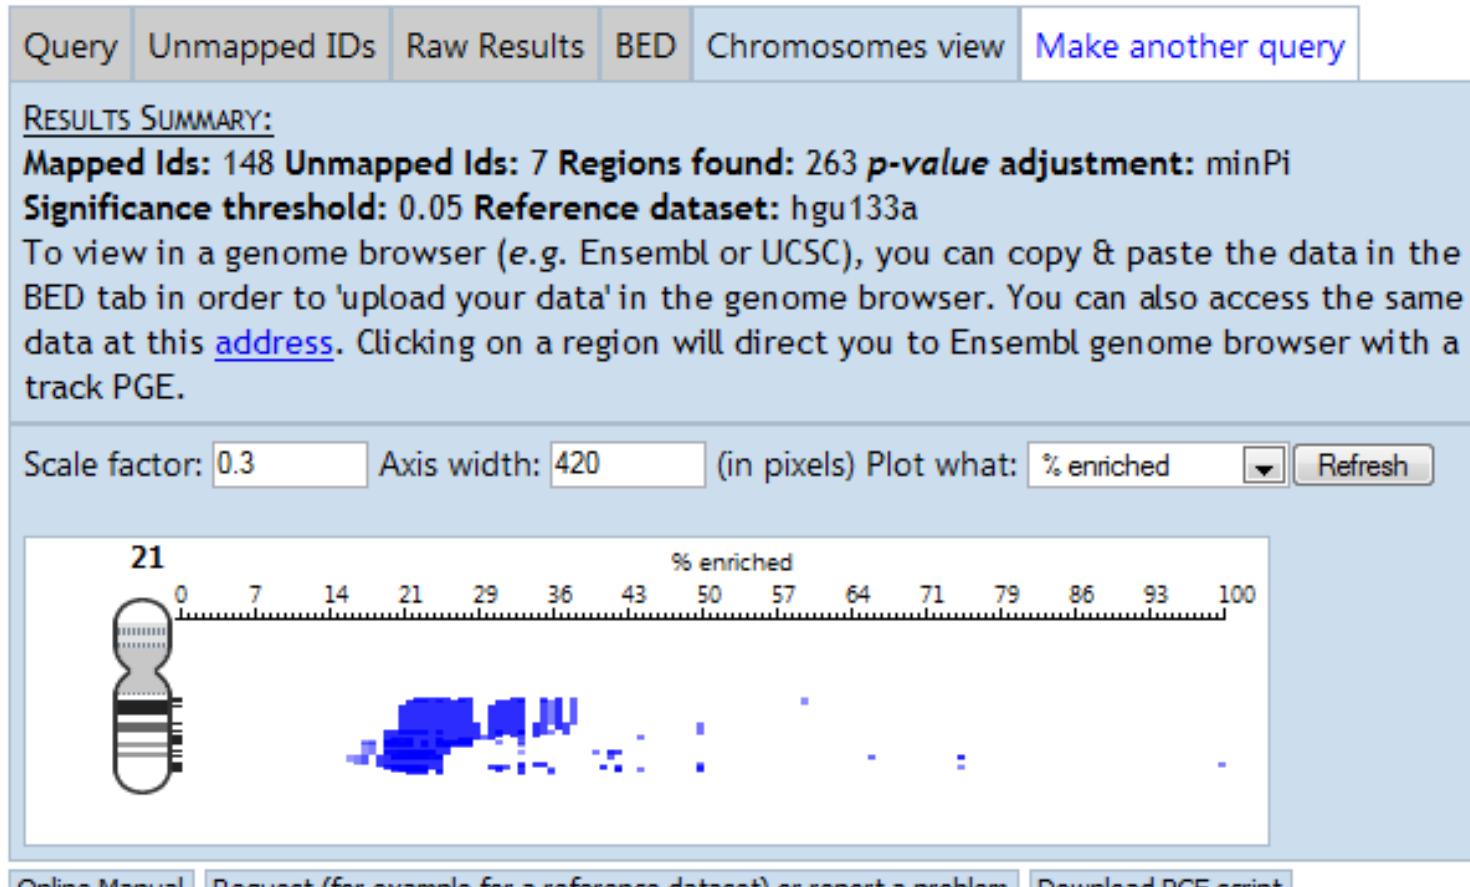

Pertinent Regions

A region is pertinent if it is:

- bounded by genes of interests
- the largest, when genes of interest are consecutive

Down Syndrome (minP_i)

Large regions tend to have smaller *p-values* while small regions tend to have higher percentage of enrichment
→ A smaller region included in a more significant one is pertinent if it has a much higher percentage of genes of interests (>50%)

Down Syndrome d.e.g. Final Results

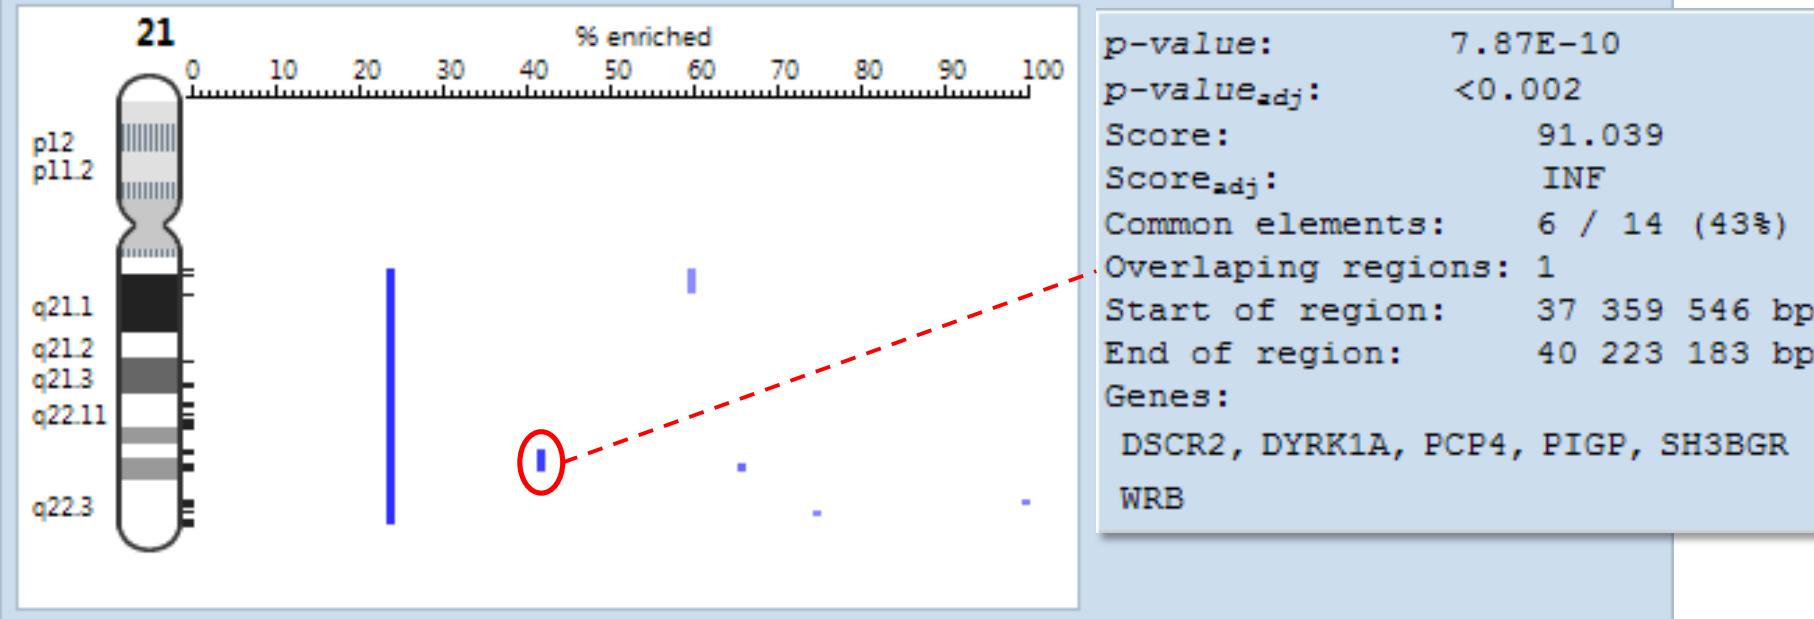

[Query](#) [Unmapped IDs](#) [Raw Results](#) [BED](#) [Chromosomes view](#) [Make another query](#)

RESULTS SUMMARY:

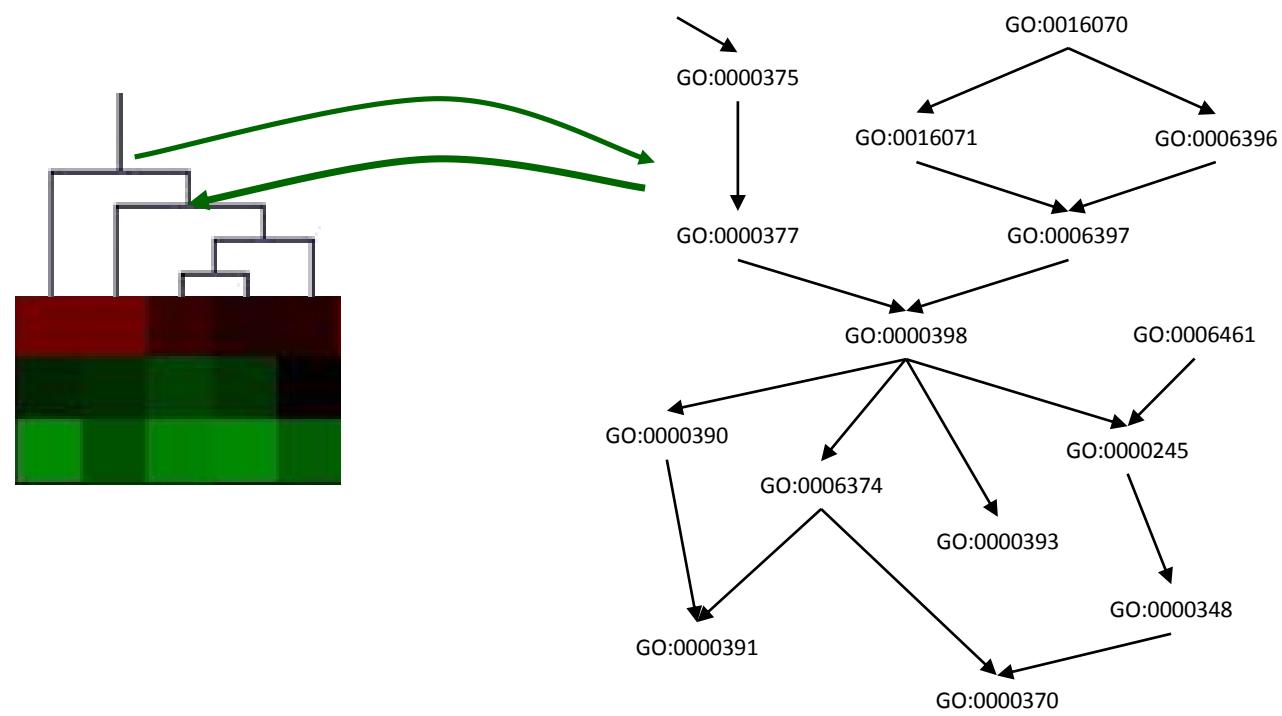

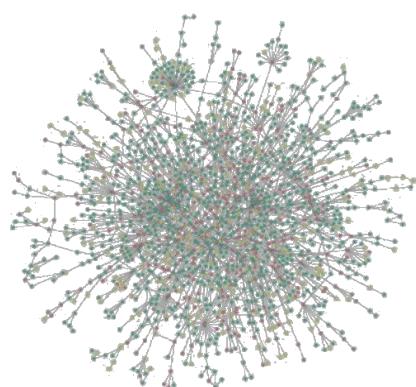

Mapped Ids: 148 Unmapped Ids: 7 Regions found: 6 p-value adjustment: minPi

Significance threshold: 0.05 Reference dataset: hgu133a

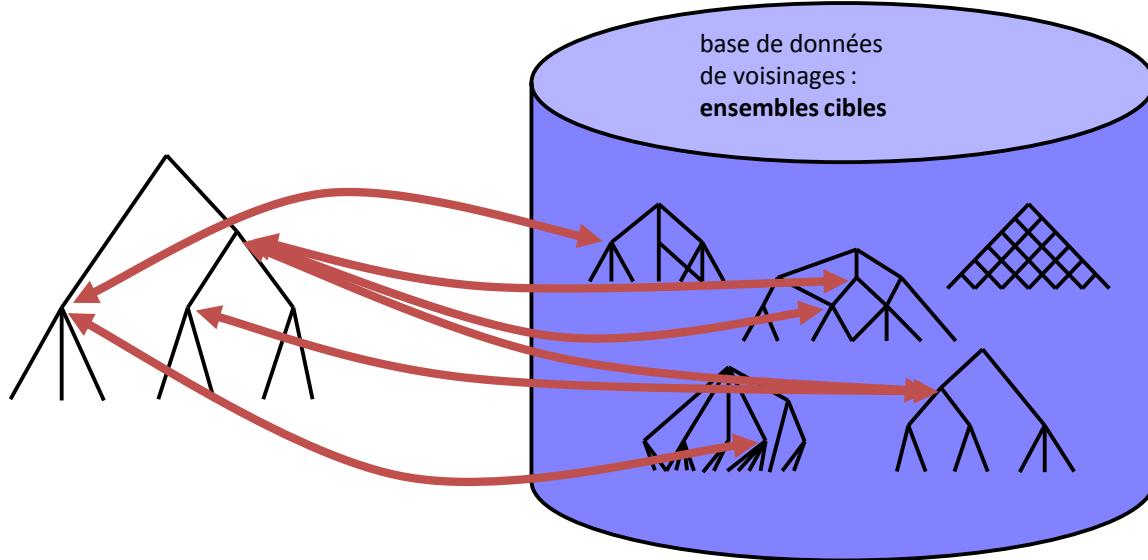

Scale factor: Axis width: (in pixels) Plot what: % enriched

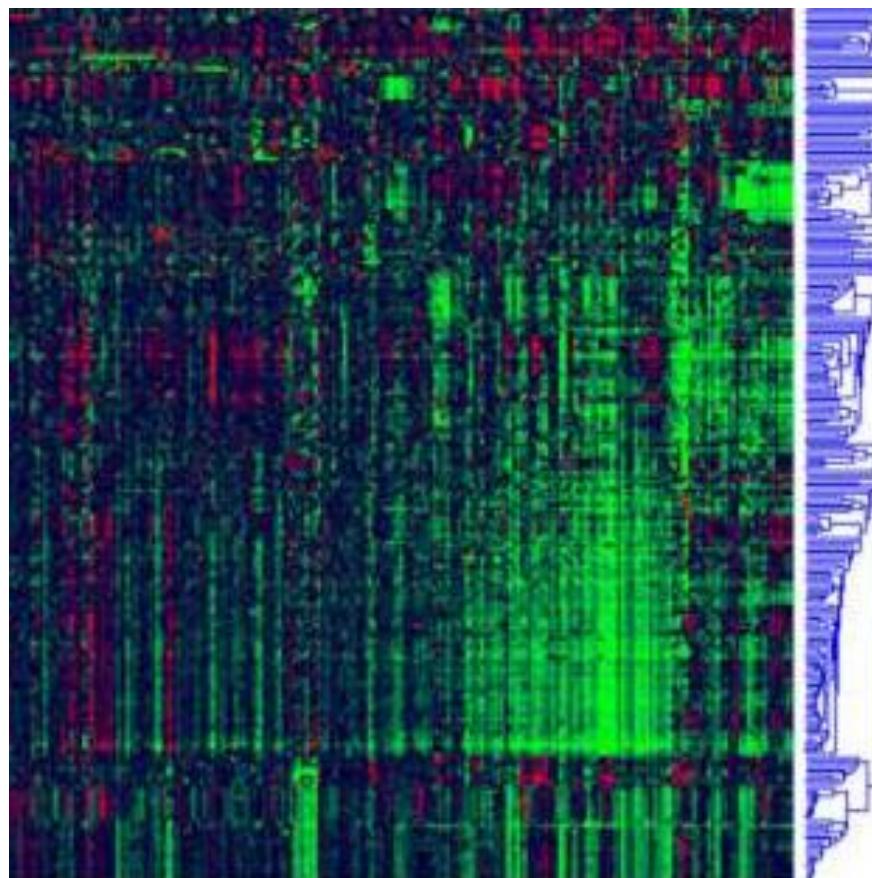

Challenges actuels

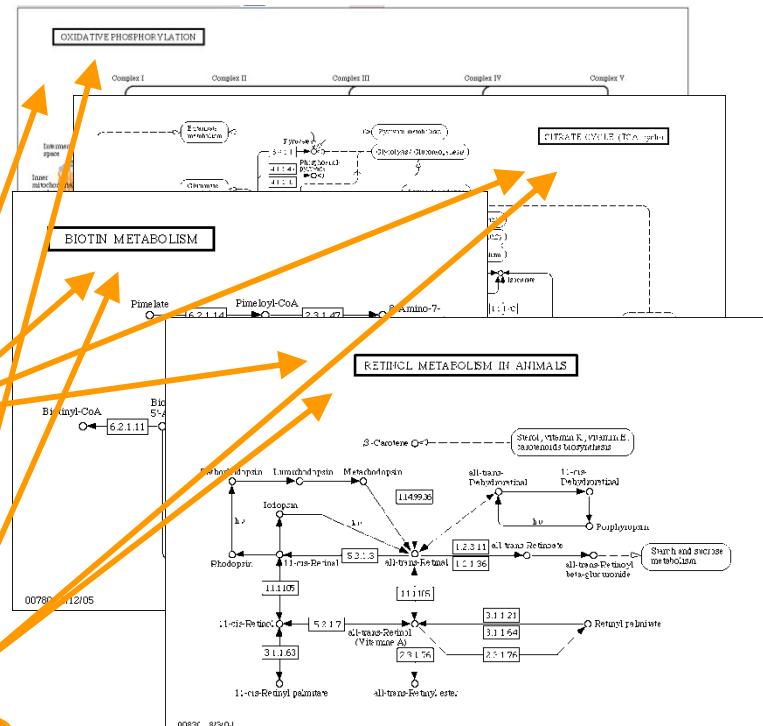

Ensembles requêtes

Analyse de données d'expression

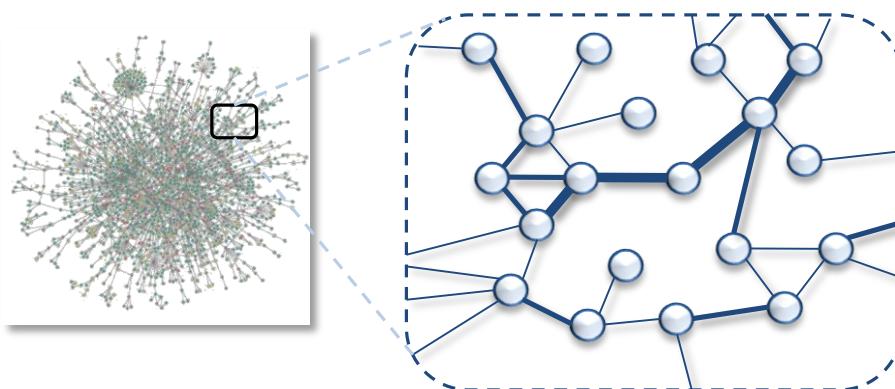

[Ferea et al., 1999]

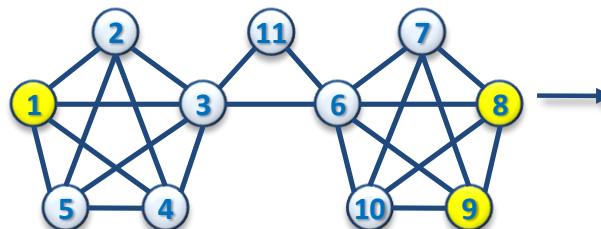

[Kanehisa et Goto, 2000]

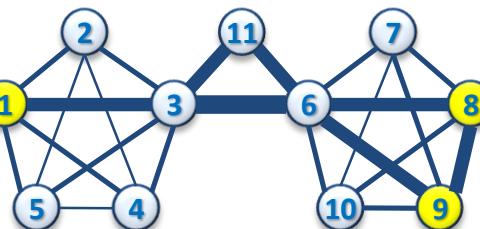

Extraction de sous-graphe pertinent & visualisation

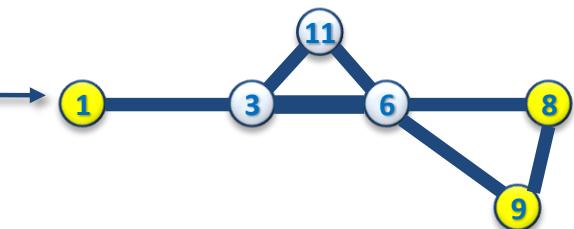

Gènes ayant la même annotation
ex : interaction with host

Marche aléatoire :
pondération des arcs

Surreprésentation :
sous-graphe pertinent

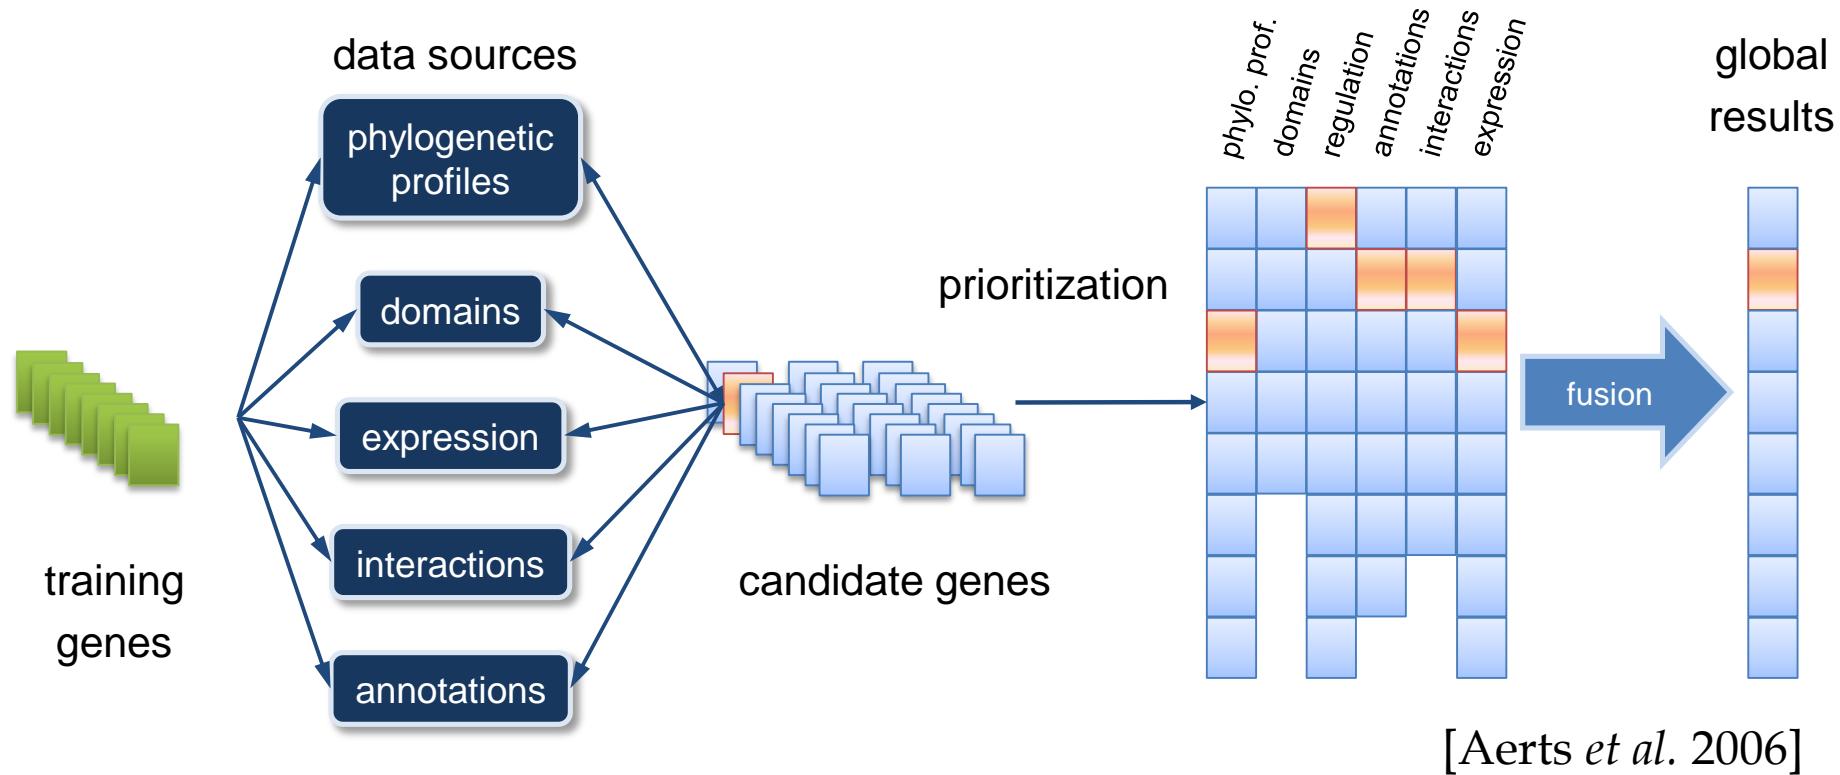

Visualisation du sous graphe
expliquant le mieux ce qui lie
les gènes d'intérêt

Idée :

- Grands graphes d'interactions physiques et/ou fonctionnelles
- Visualiser les relations entre gènes d'intérêt

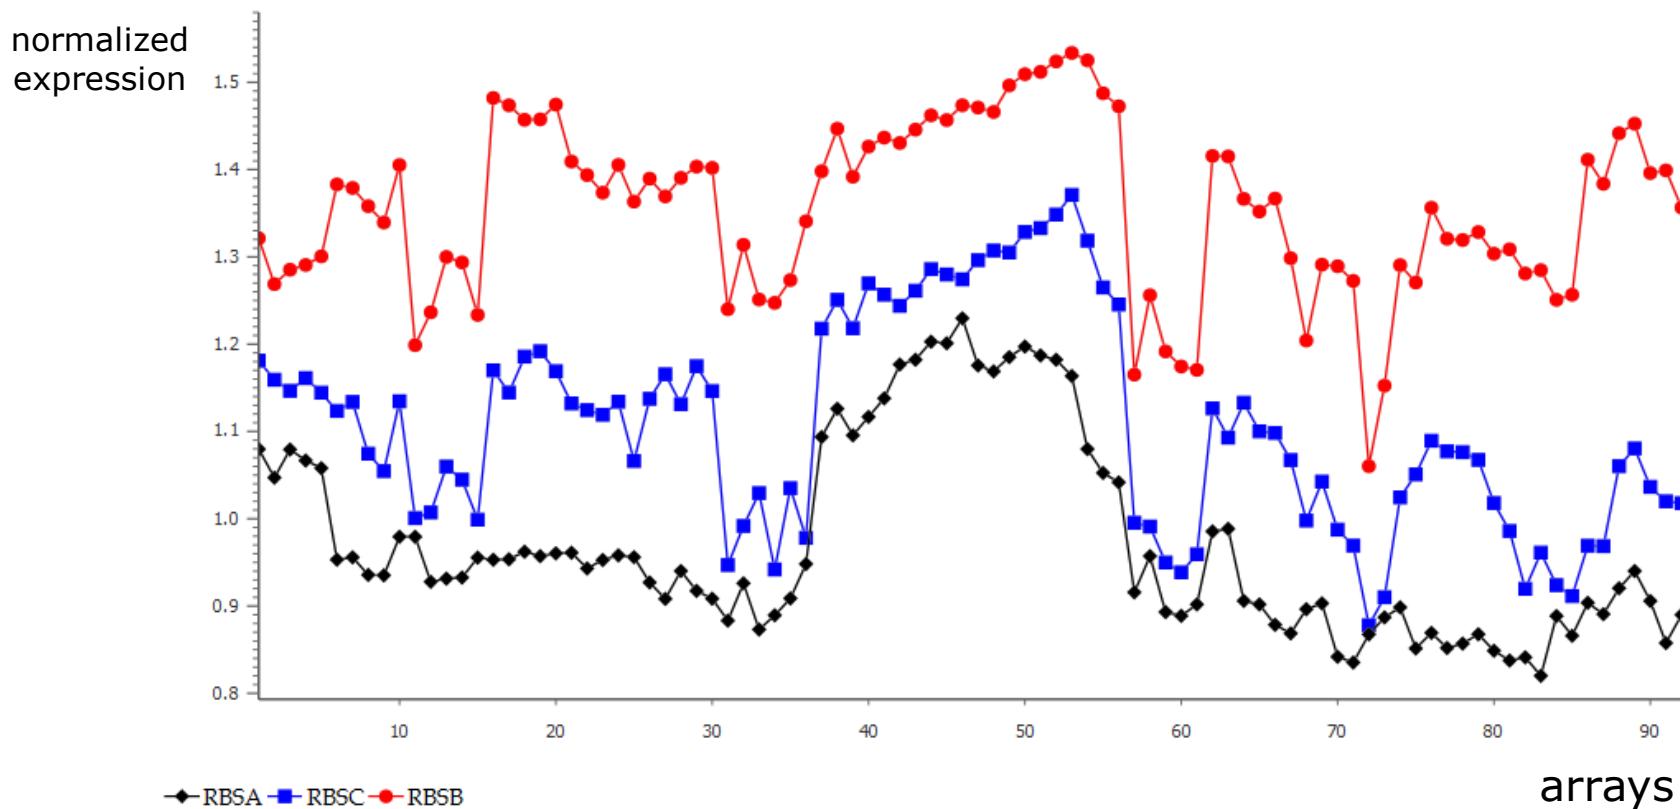

Candidate gene prioritization by genomic data fusion

- Observation: more and more post-genomic data available
- Paradox: more difficult to select the best candidates
- Goal: objective and comprehensive evaluation of candidates

Gene expression

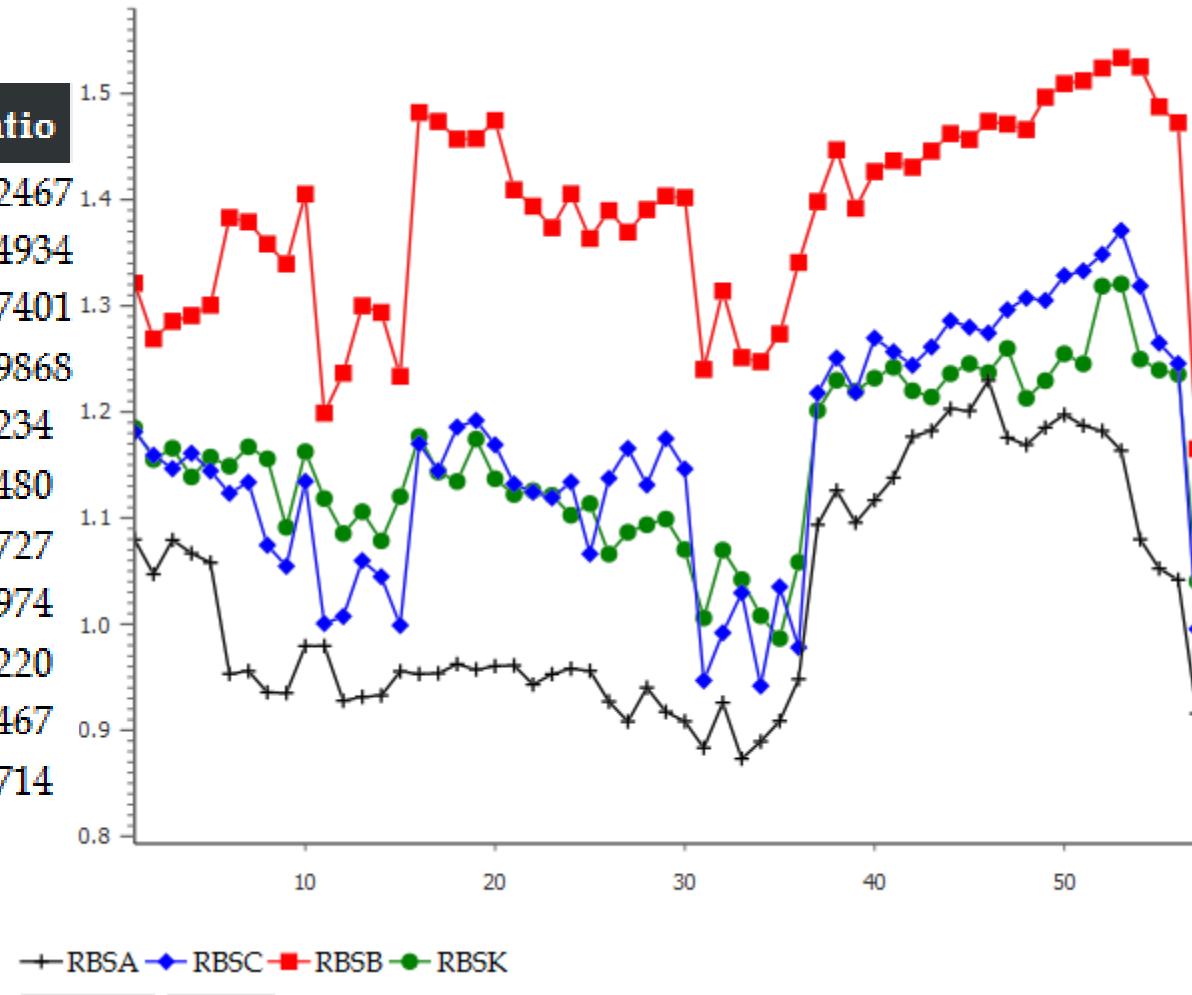

- a gene: set of expression values in various experimental conditions
- a pair of genes: dissimilarity index based on Pearson's correlation coefficient
- score : average dissimilarity

Gene expression example

- training: rbsA, rbsB, rbsC in *E. coli* K-12

Phylogenetic profiles

- a gene: presence/absence of isorthologs in other genomes
- pair of genes: dissimilarity index based on the Jaccard index
- score: average dissimilarity

training: rbsA, rbsB, rbsC

candidate	score	rank	rank ratio

Evaluation methodology

- Leave-one-out cross validation (LOOCV)

How well does it rank?
e.g. rank ratio = $2/8 = 0.25$

- for each manually curated ABC system
 - perform LOOCV on each gene: rank ratio
 - plot Receiver Operating Characteristic (ROC) curve and consider Area Under the Curve (AUC)

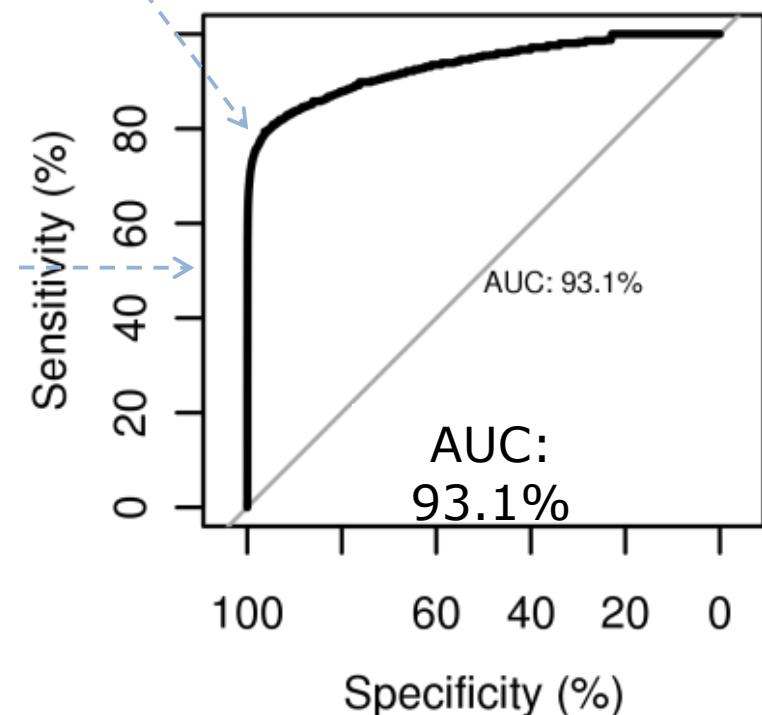

Gold standard

- ABCdb, manually curated ABC systems:
 - ◆ 135 genomes
 - ◆ 14,450 genes
 - ◆ 4,586 ABC systems

53% of the left out genes rank 1st

80% of the left out genes rank in the top 5%

fusion , tests: 14450

Weighted fusion through linear discriminant analysis

- Principle

- prioritize the candidate genes and including the training genes
- consider each data source as a measure for classification with classes: training/candidate
- perform discriminant analysis to weigh and separate training genes from background (candidates)

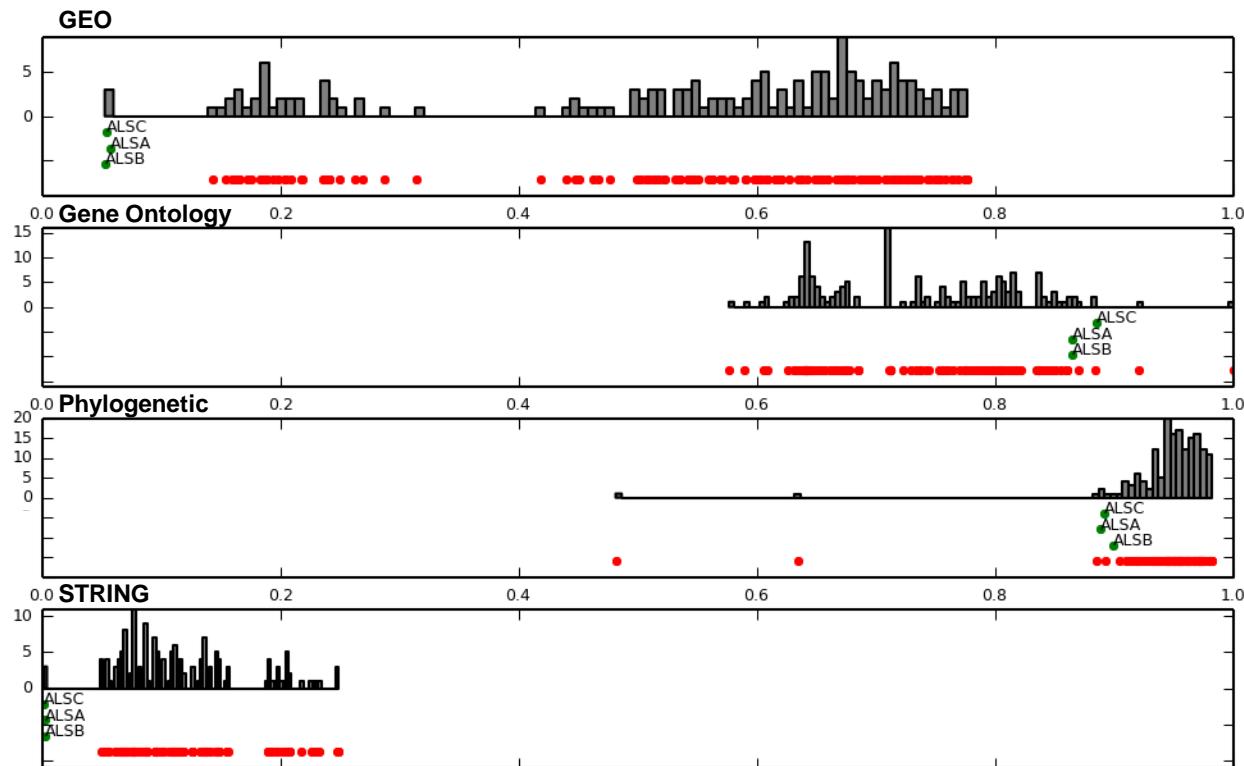

dimension	weight
variable 1	-0.1307346
variable 2	-0.7031850

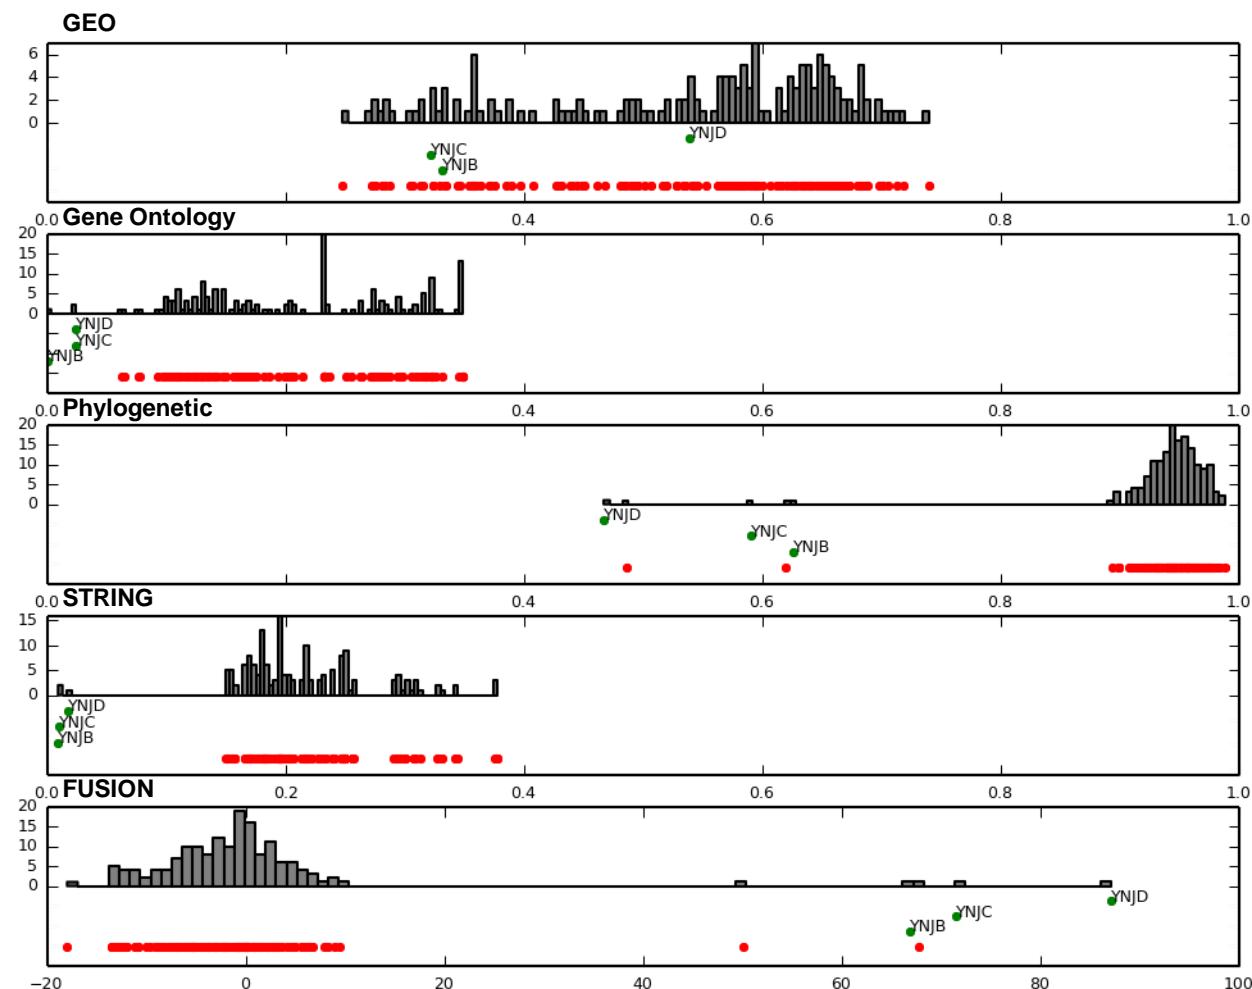

Application to *E. coli* alsA system: *alsA*, *alsB*, *alsC*

Data source	Weight
Expression (GEO)	3.5
Annotations (Gene Ontology)	-4.7
Phylogenetic	4.0
Interactions (STRING)	12.3

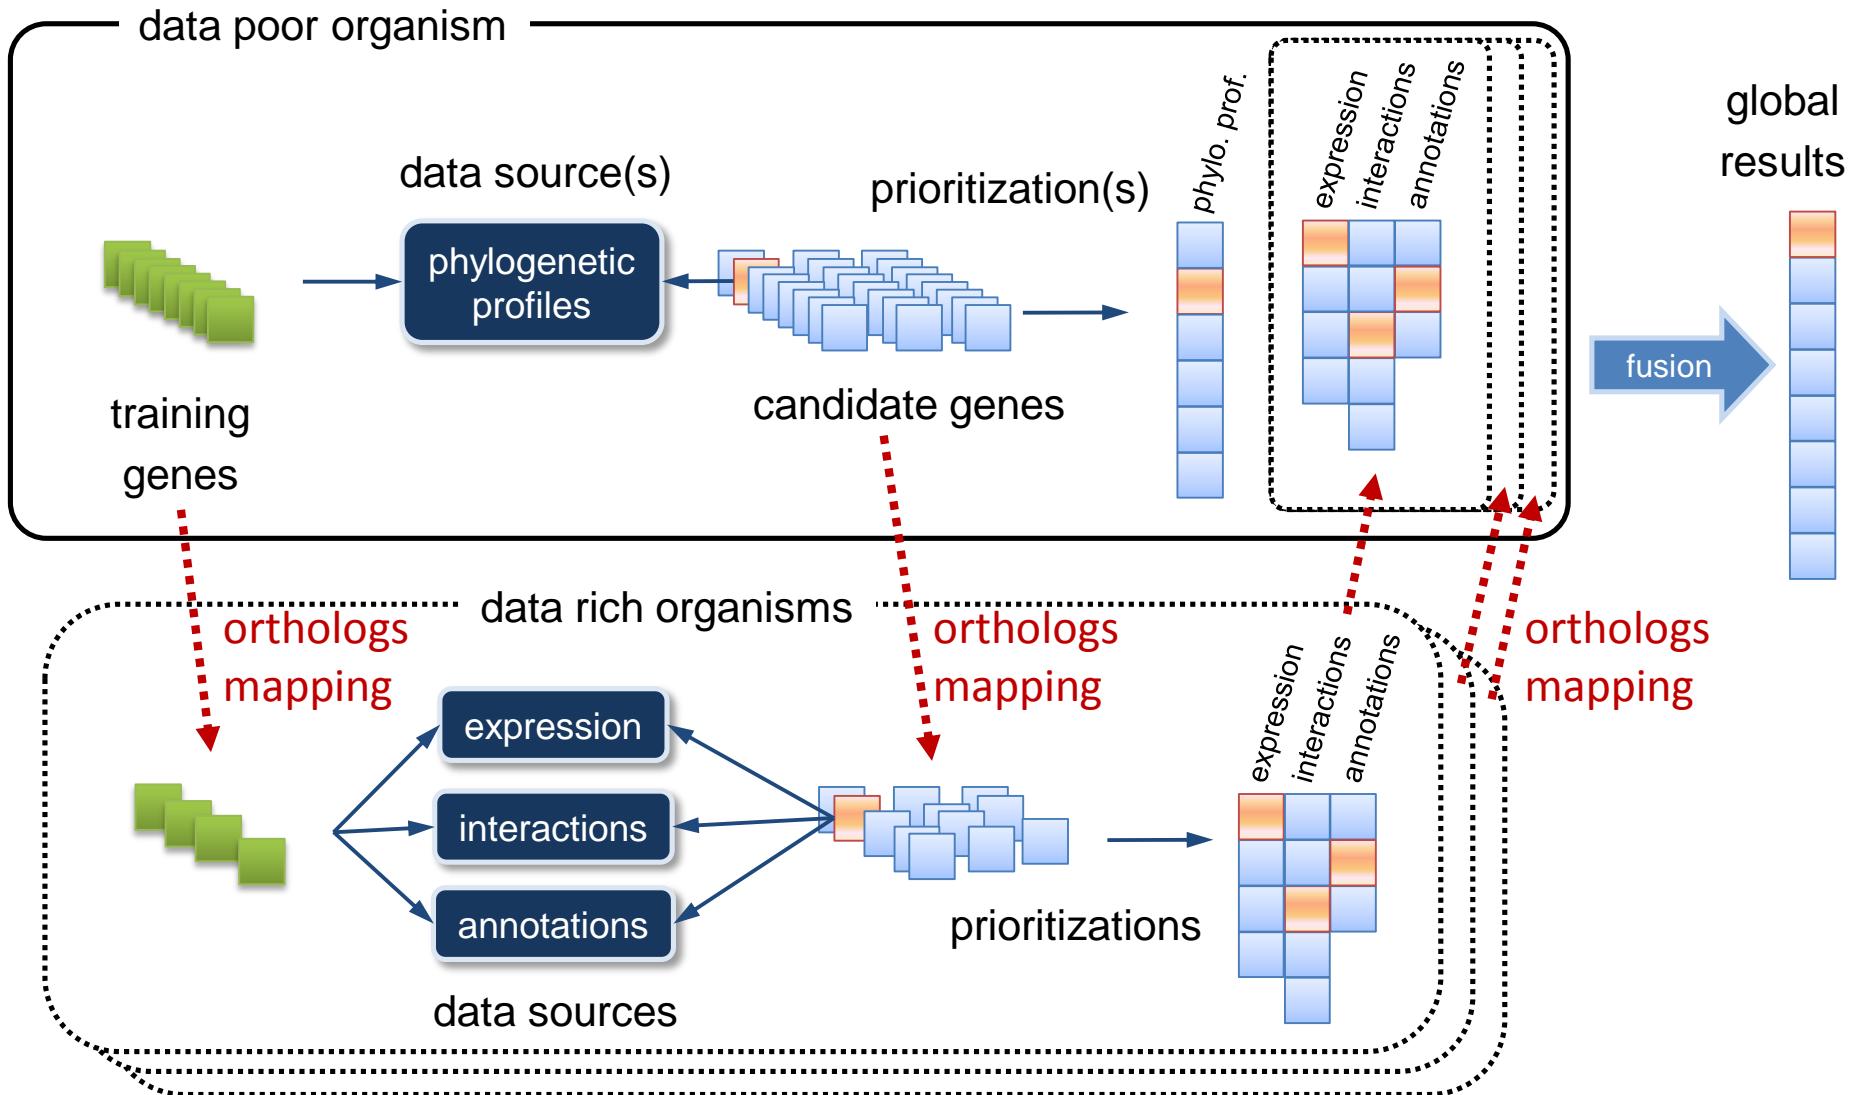

Application to *E. coli* *ynjD* system: *ynjB*, *ynjC*, *ynjD*

Data source	Weight
Expression (geo)	1.3
Annotations (go)	3.4
Phylogenetic (microsynteny)	17.4
Interactions (string)	6.6

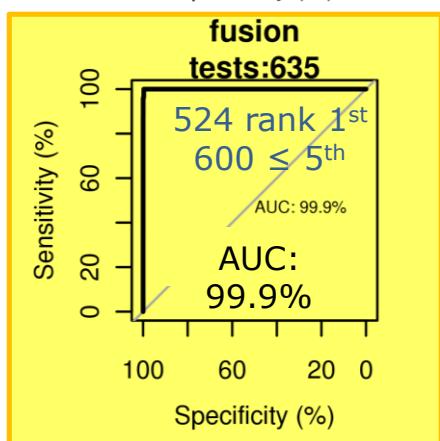

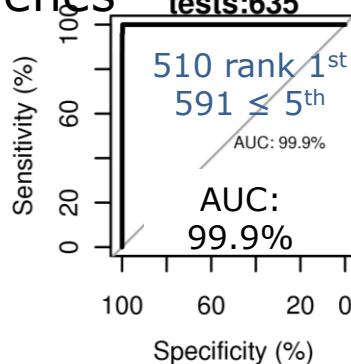

Extension of the method to data poor organisms

Performances: using other organisms data through orthology

Organisms:
B. subtilis, E. coli, P. aeruginosa
192 ABC systems, 635 genes
 fusion single organism tests:635

	# ABC genes	AUC (%)	data sources
Actinobacteria	Streptomyces coelicolor	434	93
Thermotogales	Thermotoga maritima	170	95.3
Chlamydiales	Chlamydia trachomatis	31	89.8
Mycoplasma	Mycoplasma gallisepticum	47	82.4
	Mycoplasma genitalium	36	74.8
